Sierra Pacific Turf Supply has 3 locations to serve you:
Campbell: 510 Salmar Avenue • Campbell, CA 95008
Rocklin: 1175 Tara Court • Rocklin, CA 95765
Sparks: 535 Vista Blvd., Sparks, NV 89434
I am often asked about the early history of golf in the Bay area and what are some of my favorite courses for one reason or another. I am drawn to the early courses that formed near the end of the late 1890s. Burlingame, San Francisco Golf Club, Oakland Golf Club (Claremont CC) and San Rafael Golf Club were the big four courses into the early part of the 1900s. Burlingame is the only course of those four that has stayed in its original location. As more people took up the game and improvements to clubs and balls led most courses to lengthen their courses or look for more property to start over again.

Golf courses up to this time were mostly laid out by a Golf Professional—they could layout a course in the better part of a day. Most of these were built on flat land and incorporated a bunker style that seems more similar to equestrian jumps than the bunkers that we are familiar with. In the Bay area courses like Sequoyah Country Club 1913 and San Francisco Golf Club 1918 would open up their courses only to see the need to make a number of changes to the course.

In 1920, Robert Hunter the noted author, Socialist, and Lecturer at UC-Berkeley started what would become Berkeley Country Club. He would go over the property a number of times with the likes of John Black, Sam Whiting, and William Watson. Hunter drew up plans and even made plasticine models for each green as he launched himself into designing a first rate golf course. Hunter had soil tests done and studied the property from every angle and brought in William Watson a noted golf architect to inspect his work and make some changes. His efforts at Berkeley Country Club would be the formation of his ideas that would later get published in the highly respected book, “The Links” and lead to his partnership with Alister MacKenzie.

Berkeley Country Club would play a big factor in another way as it helped to introduced Sam Whiting to Olympic Club. It would be Robert Hunter who had Whiting come to BCC after he had a lesson with him some years prior in the UK. It was a big deal as the locals felt that

As everyone knows, our industry has been challenged in recent years and it is important that we change with the times to help our facilities achieve their goals in today’s market. If elected, I will strive along with all the directors to provide avenues to help us all achieve our goals.

As a past chapter President, I have seen the importance of having strong leadership and organizational skills and how these skills help guide an Association down a successful path. Service for nine years on various GCSAA committees and as a Chapter Delegate has given me the necessary guidance to evaluate how a chapter can serve its members and their needs. I have been a Golf Course Superintendent for 17 years and have 5 years experience as a General Manager/Superintendent, which has given me valuable insight into the issues Superintendents face on a daily basis.

I take great pride in serving, and in giving back to the profession that has given so much to me. My service has and always will be met with professionalism and dedication. I would appreciate the opportunity to serve the GCSANC as Vice President.

My career started out back in 1986 working for my brother on the local municipal golf course. After college, the profession took me to the Chicago area until I landed in beautiful Sonoma County back in 2005. Since the fall of 2006, I have been the Golf Course Superintendent at StoneTree Golf Club in Novato, CA.

As everyone knows, our industry has been challenged in recent years and it is important that we change with the times to help our facilities achieve their goals in today’s market. If elected, I will strive along with all the directors to provide avenues to help us all achieve our goals.

My name is Jon Christenson, Superintendent at Monarch Bay Golf Club. I have enjoyed my current tenure as a director on the Board, as well as my service to the Education Committee. I would like to continue to serve the profession that has given so much to me by running for the office of Vice President.

Stacy L. Wallace
Golf Course Superintendent
StoneTree Golf Club

After 25 years in the turf industry, I feel it is my time to give back to the organizations that have helped my career along the way. If elected, it would be a great honor to serve and help as so many have done for me over the years.

Tim Powers
Golf Course Superintendent
Monarch Bay Golf Club

I am running for the position of secretary/treasurer because I think we have made some improvements to increase the value of our membership and we want to continue doing that. We are planning our events well in advance so people can make plans to attend and offering educational opportunities to help us do our jobs better. Meetings are a great place to build our network.

For the past three years, I have served as a Board of Director and Vice President for the GCSANC. I would like to continue my leadership roll as President in 2012. I have served on the Education Committee and co-chaired the Committee for two years. I believe we are in one of the most difficult times of our careers and I will continue to add value to our association through education, web-site enhancement and fund-raising.

there was a good enough local man or two that could meet the clubs needs. Hunter would go onto writing a letter to the San Francisco Chronicle spelling out his reasons for hiring Whiting. As construction was slowed and eventually halted due to a strike the club released Whiting from his contract and he took up shop at The Olympic Club.

Berkeley Country Club is better known today as Mira Vista Country Club.

The last photo was of the 8th green at Northwoods in Monte Rio. It was taken shortly after the course opened in July of 1929.

PHOTO QUIZ
Here is this issue’s photo quiz: this course was designed by William Watson and opened in 1924.
The worm turns: earthworm cast reduction on golf courses

A byproduct of the tea tree may provide an organic solution to a long-standing and vexing problem faced by golf course superintendents.

The following article was originally published in the September 2011 issue of GCM. Reprint permission by Ocean Organics.

Article continued from last issue.

Lees’ method involved applying powdered mowrah meal (made from seeds of *Bassia latifolia*, the butter tree of India, after the edible oil had been pressed out) and watering it in. Natural components in mowrah meal irritated the earthworms, causing them to come to the surface, where they were raked into piles, shoveled into wheelbarrows and hauled off the site.

Lees’ method is regarded as among the most important historical innovations in turf management, in part because it allowed expansion of British golf courses on upland soils, areas that previously had been ill-suited for golf because earthworms made the putting greens unplayable (4). USGA bulletins described mowrah meal as an “outstanding efficacious treatment” and a “very effective earthworm eradicator” when applied at the rate of 15 pounds to 1,000 square feet of green and watered liberally afterward (10,11). At one time, at least a dozen proprietary fertilizers and other products containing mowrah meal were marketed for earthworm control on golf courses (11). Use of the method declined in the late 1940s and 1950s with development of chlordane and other earthworm-toxic synthetic pesticides.

Mowrah meal is rich in saponins, natural soaps or surfactants found in the leaves and seeds of oats, spinach, alfalfa, chickpeas, soybeans, ginseng, tea and hundreds of other plants (6,15). Saponins have antifungal and antibacterial activity and form part of the plant’s natural defenses against disease. Plant saponins are used in manufacture of natural soaps and shampoos, cosmetics, and even...
Covers all the angles. Literally.
The new 220 E-Cut Hybrid.

The first John Deere walk greens mower with a full-contouring cutting unit.
The new 220 E-Cut Hybrid’s ball joint design combined with an electric reel drive permits maximum movement of the cutting unit to follow contours. And the cutting unit’s range of motion can be adjusted to meet the most demanding conditions. This unique cutting system can even steer through the clean-up pass—reducing stress around the outside of the green. All while a mechanical-drive traction drum keeps the mower speed consistent (to maintain a consistent frequency of clip no matter how severe an incline). All this technology was first suggested by you. So no wonder it performs flawlessly. Call us for a demo today.
as a component of the foamy “head” of root beer. Although saponins were never confirmed as the earthworm-active component in mowrah meal, it is highly likely that their detergent-like irritation of earthworms’ mucus membranes was the basis for its effectiveness. Mowrah meal is no longer marketed for earthworm management, but are there other sources of plant saponins that could be developed for that purpose?

Back to the future

In 2007, the first author attended a sports turf conference in Beijing, China, where he learned of a natural substance used in that country to control snails and slugs in vegetable fields and to suppress earthworms and casting on sports fields. The method involves applying a byproduct of tea oil manufacture. Tea seed oil pressed from seeds of the Chinese tea oil plant, *Camellia oleifera*, is used for cooking and in soaps and shampoos, margarine and other products. Tea seeds, fruits and oil are rich in antioxidants and are used in Chinese traditional medicine. After the seeds are crushed to extract the oil, the residue is ground into meal or pressed into “cake” or pellets. Tea seed meal is used as a component of animal feeds, as an organic fertilizer and for other purposes.

Websites of many Chinese tea oil manufacturers (for example, www.camellia-oil.com) claim that tea seed meal can be used to control earthworms on sports turf and lawns. A 2007 search of the worldwide scientific literature, however, found no references or data supporting that claim, and no information concerning rates, timing, effectiveness or other aspects of using tea seed meal to manage earthworms and casts. But like mowrah meal, tea seed meal is high in natural saponins (5,13) and therefore worth evaluating as a possible substitute for Peter Lees’ historical remedy for cast reduction.

Testing for cast suppression, 2007-2008

We started researching tea seed meal in autumn 2007 to determine whether it could be used to reduce earthworm casts on playing surfaces. Most of the early trials were done on a large, predominantly Penncross creeping bentgrass push-up green at the University of Kentucky’s A.J. Powell Jr. Turfgrass Research Center near Lexington. The site had high numbers of actively casting earthworms (>95% *Apporectodea* species). Other trials were done in fairway-height creeping bentgrass and on a perennial ryegrass fairway. A full account of the experiments was published in a peer-reviewed international scientific journal (13).

Our initial tests were with crude tea seed meal pellets (3.2 millimeters diameter; 5–8 millimeters long) and powder obtained from a source in China. The powder, essentially a dust, proved awkward to apply, so later work focused on the pellets. Application of the pellets at 6 or 12 pounds/1,000 square feet (2.93 or 5.86 kilograms/100 square meters) followed by irrigation, quickly expelled as many as 200 worms/10 square

Most of the expelled worms dried up and died on the turf surface; other experiments indicated relatively few worms that burrowed back down survived. Expelled worms appeared flaccid and quickly desiccated, evidently because their mucus coating had been disrupted. A single tea seed meal application in early April 2008 reduced castings in replicated plots on the push-up green by >95% for at least five weeks (Figure 1). In another trial on the push-up green, application of tea seed meal in early October reduced casts by 98% after two days and 83% after 30 days (Figure 2). Finally, a sequence of lab trials, called bioassay-guided fractionation, confirmed that the chemical basis for tea seed meal activity on earthworms is the natural triterpene saponins found in tea seeds.

We tested two methods for removing the expelled worms from putting green surfaces (13). Locations of expelled worms were marked with dabs of orange turf paint. The following morning a single pass with a greens mower removed about 66% and one pass with turf sweeper removed 40% of the cadavers.

In other tests, the tea seed meal pellets did not provide any control of white grubs or cutworms in field plots (13). Unlike earthworms with their mucus-covered skin, insects have an exoskeleton that seems to protect them from being dried out from exposure to saponins. On the plus side, the pellets also did not harm the tiny soil-inhabiting insects and mites that help to decompose thatch and grass clippings.

Non-native (invasive) earthworm species

The first and second authors began a systematic survey of the earthworms on Kentucky golf courses in spring 2011 to clarify which species are associated with surface casts. Several thousand specimens were collected from a total of 18 fairways on six different courses. We also sampled worms on push-up greens. All of the culprits appear to be non-native, invasive species. At least seven species have been identified, the most common by far being *Apporectodea* species. The Kentucky earthworm surveys will continue for at least another year. Nightcrawlers, which also are invasive, seem to be responsible for most of the casting problems in the Pacific Northwest (1).

A natural organic fertilizer

After hearing about our earthworm research at an educational seminar, representatives of a developer and manufacturer of natural fertilizers and biorational materials for turf, ornamental horti-
culture and specialty agriculture (Ocean Organics Corp., Ann Arbor, Mich./Waldoboro, Maine) expressed interest in developing an organic fertilizer based on tea seed meal. They formulated the raw meal into a finer, proprietary blend of tea seed meal, kelp extract and composted poultry manure, called Early Bird 3-0-1 Natural Organic Fertilizer, suited for golf course use.

Caveats and limitations

The goal of this research was to facilitate development of a natural product that can be used to alleviate the problem of excessive earthworm casting on golf courses and sports fields. Early Bird is not labeled for earthworm control, although registration as a biological pesticide is being pursued. Since tea seed meal is a natural product, it is subject to variation in saponin content related to genotype of the source plants, growing location, and how the raw material was processed, handled and stored (5). Early Bird is, to our knowledge, the only turfgrass fertilizer with tea seed saponins for which quality is monitored.

Saponins are distributed in diverse plant species including many cultivated crops regularly consumed by humans (6,15). The saponins in tea seed meal have low acute oral and dermal toxicity for vertebrates including mammals and birds (15). Biodegradation is rapid, within three to five days in the field.

High concentrations of saponins are toxic to fish, but tea seed meal is considerably less toxic to fish than some other products (for example, pyrethroid insecticides) regularly used on golf courses (13). With sensible guidelines (for example, buffer zones around ponds and streams, and no treatment of saturated soils where runoff could occur), it should be possible to use a tea seed meal-based product without harming aquatic organisms.

An issue with earthworm expellants such as tea seed meal or mowrah meal is the unsightly nuisance and temporary odor when large numbers of worms die on the surface. In our experience, the expelled worms dry up relatively quickly and most of them are removed by mowing. The dried-up worms are less evident on fairways than on greens. Superintendents who tried Early Bird report removing expelled worms by mowing, with a backpack blower, vacuum, water hose or combinations thereof. The ideal remedy would provide economical long-lasting suppression of casting without killing the earthworms, but such a product has not yet been found.

Conclusions

This research indicates that tea seed meal, a
