You're Always Ahead of the Game with a COVERMASTER® Raincover...

“Great Service... The Best...” wrote Chip Baker, Assi. Basketball Coach, Florida State University, Tallahassee, FL.

Chip’s comments confirm what we hear from the many groundskeepers who use a COVERMASTER® raincover to keep their fields dry and ready for play. Call us and we'll gladly tell you more.

The COVERMASTER® Advantage...
- Superior in strength and UV resistance
- Outstanding heat reflective properties
- Lightweight - easy to handle
- Widest materials for least number of seams
- Largest choice of weights and colors
- Resistant to naturally degradable waxes

What Manual?

By Fred Castenschiold

I have been selling quality turf care equipment for over thirty years. I am still amazed how so few customers refer to their owners/operator manuals until it is too late or not at all. These manuals are a great source of information for the supervisor, operator and mechanic.

When taking in a trade on equipment, I try to always recover the original manuals from the account to pass on to the new owner. Often the condition of these manuals condition indicates that they have not been referred-to much! It is a good idea to always record the model and serial number of the equipment on the cover of the manual for quick reference when discussing the need for service or parts. It also a good idea to make sure you read and understand the operators’ manual for your machine before operating or servicing it. Become familiar with all safety signs (decals) on the machine. Some manufacturers provide operator training videos which help demonstrate procedures for safe operation and daily maintenance.

Preventative maintenance of your equipment will help you to get the most out of your investment. If you do not have a preventative maintenance program it would be good to start one soon. Sometimes we go long stretches between those rainy day opportunities. Doing scheduled maintenance and adjustments will prolong the life of your equipment, help prevent expensive downtime and give the best possible quality of cut and performance. Experience has shown that a high percentage of problems have developed over a period of time and could have been prevented by adjustment, lubrication, or other required maintenance.

When referring to the manual, take into consideration how harsh your conditions are and remember that manufacturer recommendations for service are the minimum requirements. If we have a long dry spell and your equipment is working daily in a particularly dusty environment you may wish to consider oil and air filter changes more often.

Some of my customers have come-up with great maintenance schedules which they live by. Keeping records for each machine insures that maintenance procedures are being performed at the proper time. These records could also help you predict parts to have on hand. By keeping blades, belts, filters, etc. on-hand, you will not be caught in a situation where important maintenance was not performed on-schedule because of a lack of parts.

Know what is contained in your manufacturer’s warranty. Most warranties are two years in the commercial field. When talking to a service manager regarding a possible warranty issue you will need to refer to those model and serial numbers. Remember? … The model and serial numbers you wrote down on the front cover of your manual!

Fred Castenschiold is Sales Representative, Storr Tractor Company and SFMANJ Vice President.

DID YOU KNOW?

The term subsoling refers to tillage of the subsurface without inversion for the purpose of breaking-up dense soil layers that restrict water movement and root penetration.

Use the Easiest Non-Verbal Communication Strategy to Enhance Your Professionalism

Sports Turf Managers Association Editorial Staff

Good communication is a cornerstone of great professional relationships. One communication strategy that is often overlooked is dress. How you dress is another way you communicate to your peers, your staff, your employer and the end users of your sports fields.

Dressing in a professional manner suggests that you are well organized and portrays self-confidence. The impression is one of who is knowledgeable and in control. (Wow, all of that from a pair of Dockers and a golf shirt!). Obviously, we aren’t talking coat and tie — unless the occasion calls for it. When you are physically working beside your staff on the field, of course you will be wearing work clothing, but think about keeping a change of clothing at your office for meetings or when you will be spending several hours in the office more visible to your employer.

Consider providing collared staff shirts to bring a more unified appearance to your crew, but wear a different color shirt so that you are distinguishable as the manager in charge. Be conscious of what your clothing says about you — faded tee shirts promoting old rock groups may bring a bit of nostalgia to your day, but they do not do much to position you as a professional sports turf manager.

Impressions do count. According to Ollie Stevenson, author of 101 Great Answers to the Toughest Job Search Problems, found that in an interview situation, interviewers make an immediate overall judgment about you in the first five seconds. That applies to all first impressions. Five seconds isn’t long so you are being judged on what you wear and how you react. Make the first five seconds count. Be dressed appropriately and remember, professionals do shake hands. Be sure your grip is firm and sincere and you make direct eye contact when you greet someone.

How do you dress for your chapter meetings? What type of role model are you for those who are just entering the profession and what type of message are you sending to them?

The job of a sports turf manager requires a strong knowledge of agronomy, pest management, environmental issues, sports strategies, and intimate knowledge of rules and regulations so that you can manage safe playing surfaces for your athletes. Be recognized for the knowledge, skills and abilities you bring to the game and garner the respect you deserve. Don’t let a sloppy appearance downplay your importance when it is so easy to dress more professionally.

SPORTS FIELD IRRIGATION AUDITS - PART II

Don Savard, CSFM, CGM

Editor’s Note:
This article is a continuation of an article Sports Field Irrigation Audits – Part 1, which can be found on Page 6 of the July/August 2007 edition of SFMANJ Update.

Don Savard, CSFM, CGM

At this time it is necessary to gather information from outside sources. I used information gathered from the internet that was published by the Delaware Cooperative Extension Service and from the book “Sports Fields-A Manual for Design, Construction and Maintenance” by Puhalla, J; Krans, J; Goatly, M; John Wiley & Sons Inc.

Next I had to determine the average water holding capacity of my soil. Different soil textures have different water holding capacities depending on soil pore space. Sandy soils have large pore spaces between the soil particles, silt loams and clays have minute pore spaces. While sandy soils with their large pore spaces can absorb volumes of water quickly, the water also drains quickly. The soils such as silt loam and clays hold their water much longer. My soil type was silt loam which has an average water holding capacity of 0.17 to 0.23 inches of water stored per inch of soil; multiply by 12 to get inches of water per foot of soil (Delaware Cooperative Extension).

Following that, the next step was to find out how much water the turf needed and was using and figure out the irrigation volume and frequency. A turfgrass plant is more than 90% water and requires a different amount of water than a shade tree. Evapotranspiration, the process where available water in the soil evaporates into the atmosphere and transpiration the process where a plant gives off water vapor and oxygen as a byproduct of photosynthesis, is higher during the warmer parts of the year than other times. So, transpiration rates vary every month.

Monthly Potential Evapotranspiration (PET) values can vary slightly from year to year and PET values vary by month. The PET value for Delaware in May is 3.72 inches; for daily PET values divide the monthly PET value by 30 (Delaware Cooperative Extension). If you can measure the ET at your site, you can become very precise.

The water requirement Crop Coefficient ($K_c$) is a scale used as a multiplier in irrigation audit equations. The water requirement crop coefficient for cool season turfgrass is 0.6 to 0.8; the water requirement crop coefficient for warm season turfgrass is 0.5 to 0.70 (Puhalla et al., 2001).

Using the information found from my data collection as well as the information in the preceding tables, I was able to find the irrigation frequency using the following formula:

$$\text{Irrigation frequency} = \frac{\text{Average water holding capacity} \times \text{root depth} \times \text{management allowable depletion}}{\text{potential evapotranspiration} \times \text{crop coefficient}}$$

I found the run time frequency using the following formula:

$$\text{Run Time} = \frac{\text{net precipitation rate} \times \text{irrigation application efficiency}}{\text{pet} \times \text{irrigation frequency} \times \text{crop coefficient}}$$

So what did I find out after all that work? Irrigation frequency is all about evapotranspiration which varies each month. Assuming average temperatures and humidity and no rain, I would only need to irrigate once every 7 days in May. Because there is less evapotranspiration in April, I would need to irrigate once in 14 days. In July there is more evapotranspiration so I would need to irrigate every 4 days.

I found that the run times would vary from about 108 minutes in April, to 113 minutes in July to 117 minutes in May. For convenience, I rounded up to 120 minutes for the audit in May. My Kifco water reels were calibrated to travel 60 feet per minute, applied ½ inch of water during the first run time. So, by pulling back out a second time immediately following the first run, I could supply the field with a full inch of water.

(continued on page 12)
As a result of conducting an irrigation audit on my site, I was able to save over $2,000.00 in my irrigation budget and over 150 hours of my personal time.

Remember that the idea is to irrigate the soil, not the turf. Consider the concept of the soil as an H\(_2\)O bank account for your turf. Just like your personal checking account, try to maintain a prudent balance of moisture in the root zone so as not to become overdrawn and stress the turf.

As many of you know, the turfgrass industry lost a dear friend and colleague in September 2005. We will all miss Henry very much and would like to ensure that his legacy live on. The Indyk family would like to establish a memorial fellowship to support graduate students interested in applied turfgrass science. This fellowship is being endowed by the Henry W. Indyk Graduate Fellowship Committee. (1) To do this, turfgrass professionals all over the world will contribute to the Henry W. Indyk Graduate Fellowship Fund. (2) The first scholarship award will be made in the fall of 2006 to graduate student(s) with a significant advancement in research relating to turfgrass science. (3) The Henry W. Indyk Graduate Fellowship Fund will be managed by the Graduate Fellowship Committee. (4) Any individual or group with a desire to contribute to the fund may do so by making a contribution to this scholarship fund. (5) Contributions are tax deductible. (6) We are seeking individuals who have a significant amount of time and money that they wish to dedicate to preserving Henry W. Indyk’s memory and legacy.

Donations may be made by check payable to: Henry W. Indyk Graduate Fellowship Fund. 7 College Avenue, New Brunswick, NJ 08901.
