Cornell Sells Color Photo Guide to Turf Problems

Twenty-four common turf problems, such as leaf spot disease, chinch bug damage, drought, and fertilizer injury, are presented in glossy color photos along with a written description of each condition in a handy pocket-sized guide, produced by Cornell University, called "Picture Clues to Lawn Troubles."

The booklet is written by Norman J. Smith, Nassau County Extension Agent, in collaboration with Professor John F. Cornman, Horticulture Department, Cornell University.

Although the booklet contains no specific recommendations for control or correction, general suggestions are made, and it is an excellent aid to one who may not be familiar with the overall looks of some of the lawn ill.

It costs 75 cents and can be obtained by writing either to the Mailing Room, Cornell University, Ithaca, New York, or the Nassau County Extension Service Association, Agricultural Department, 1565 Franklin Ave., Mineola, Long Island, New York.

New Bulletin Gives Aquatic Weed Control Specs for Ill.

Illinois State Department of Conservation recently published a booklet, "Aquatic Weeds, Their Identification and Methods of Control" by Albert C. Lopinot, Fishery Biologist.

This 47-page booklet discusses the case against aquatic weeds and various control methods of the past. Included also are instructions to determine areas to be treated, dosage needed, and application means.

Since identification is essential, the greater part of the booklet is turned over to plant drawings and descriptions of those weeds found in Illinois. A chart of recommended chemicals and dosages accompanies each species.

A copy may be obtained free by writing for Fishery Bulletin No. 4, to Division of Fisheries, Room 102 State Office Building, Springfield, Ill.
