of concentrate in 1 pint of water. Put the cap on the jar, and shake the jar 10 times. Place all test jars side by side for easy comparison. Observe for visible settling or layering at 5, 10, 15 and 30-minute and one-hour intervals. Any material which shows layering or settling within 5 minutes should be considered unsatisfactory. This layering may occur at either the top or bottom of the jar.

II. Comparison with Skim Milk

Milk consists of small globules of oil and fats suspended in a water phase. It is a "quality" emulsion that can be used as a standard for comparative purposes.

Materials needed:
(a) A piece of flat glass.
(b) Black background.
(c) Sunlight or a strong artificial light.
(d) Eye dropper.
(e) Skim milk.

Procedure: Place the glass plate on the black background. Mix the pesticides as described in the settling test. Place one drop of milk next to each drop of "spray mix." The more closely a formulation resembles milk, the better its quality. Materials which appear granular or gritty should be considered questionable.

III. Comparison of Globule Size (Optional)

(a) A few spraymen have microscopes. For these individuals it is easy to check globule size. Mix the pesticide in question as described in the settling test. Place a drop of the spray mix on a glass slide, cover with a cover slip, and observe with the microscope. One formulation can be compared to another very easily.

(b) 35 mm slide projectors can also be used to compare globule size. Obtain a 2" x 2" glass slide binder for each formulation to be tested. Mix the pesticide as described in the settling test. Place one drop of "spray mix" on a 2 x 2 glass slide, then cover the drop with another 2 x 2 glass slide. Tape the two pieces of glass together.

Set up your slide projector so that the projected "picture" of a 35 mm slide covers an area 5 feet wide. At this distance your projector gives about 40-power magnification. Place the slides which have been prepared in the projector and focus.

SOUTHERN WEED CONFERENCE
Set for Memphis, Jan. 15-17

"Winter Weed Removal from Dormant Turf," is one of several key subjects to be discussed at the annual Southern Weed Conference when it meets January 15-17 at the Heidelberg Hotel in Jackson, Miss.

Also of particular interest to urban/industrial vegetation managers are talks on "Tolerance of Warm Season Turf Grasses to Herbicides," by Dr. E. O. Burt of the Florida Agricultural Experiment Station in Ft. Lauderdale, and "Crabgrass Control in Turf," by three researchers from Virginia Polytechnic Institute, Blacksburg.

The Southern Weed Conference is open to all interested applicators, and others, who may obtain additional information by writing to James M. Brown, Chairman, Public Relations Committee, Southern Weed Conference, P.O. Box 12285, Memphis, Tenn. 38112.

MALATHION

Outdoors, Malathion protects shrubbery, flowers, fruits and vegetables from leafhoppers, beetles, many species of worms, and other destructive pests. In the greenhouse, Malathion controls aphids, mites and soft scale. A friend in the home too, this all-around insecticide kills flies, mosquitoes, silverfish, bedbugs, carpet beetles, crickets, fleas, ticks, and resistant roaches. Malathion has high residue tolerance. In fact, it is so safe that it can be applied directly to grains, seeds and household pets. Premium Grade Malathion is almost odorless. For successful growing and repeat sales, formulate with Malathion and sell Malathion formulations in your retail store.

PROLIN* RODENTICIDE -- ANOTHER MONEY-MAKER

Prolin bait, available under various brand names, is as safe as warfarin and more thorough. It contains warfarin plus a helper ingredient for devasting two-way action against mice and rats. Write Prentiss for dealer information.
