Got an acre or more of turf to maintain? Then you need the Ryan Grounds Groomer. It dethatches, sweeps and mows large turf areas. Even prepares seed bed for overseeding.

The tractor-drawn Grounds Groomer has vertical blades that slice and literally blow lifted thatch, leaves, twigs, pine needles and cones, and other debris into the big 5-cubic-yard hopper. Even picks up eucalyptus leaves.

Reel is designed to dethatch while mowing. Reel is easily converted for complete flail mowing of rough grass. Reel can be raised or lowered from the tractor seat... and hopper can be dumped. Use the versatile Grounds Groomer all seasons for general turf maintenance.

California Weed Conference

Restrictions on the herbicide 2,4,5-T and how to avoid similar government "mistakes" occupied the 800 weed control specialists who attended the 23rd annual California Weed Conference in Sacramento.

The conference heard a proposal for a national laboratory to test and register pesticides, a call for greater professionalism among pesticide applicators, and advice on pesticide safety.

"There is no doubt whatsoever we are living in an era of chaos resulting from consumerism, lack of understanding and education, political expediency and the unfortunate, misinterpreted, misstated and misemphasized information through the public communications media," stated Dr. Emil Mrak, keynote speaker and chairman of the federal Pesticide Advisory Committee and formerly chairman of the federal Commission on Pesticides and Their Relationship to Environmental Health.

"Strange as it may seem, though we have the most abundant and diverse food supply in the world, we have in our nation the greatest number of food warriors the world has ever known, yet our longevity has gone up and there is no evidence of any harm (with two relatively minor exceptions) to the human organism caused by food toxicants," Dr. Mrak said. "On the other hand, there is a great deal of evidence that tobacco causes harm and we go along merrily permitting its sale and use."

Mrak said in his opinion the real need is for government to publish pesticide safety protocols which manufacturers and the public can understand and rely upon. Though his remarks dealt with food produc-
tion, they held obvious relevance to all pesticide and herbicide users present because a panic decision to protect a food supply can have severe implications for all weed and pest control.

"To my knowledge there has been little if any work done to determine the relation between dosage of chemical additives or pesticides in foods to their effect on the organism," he said. "The customary procedure has been to feed extremely massive doses to animals, in some cases amounting to thousands of times, in fact, many thousands of times, that which might be ingested by humans in food on a weight per weight basis.

"Furthermore, the chemical might be force fed or injected as was done with 2,4,5-T rather than taken into the body in food as the human would ordinarily do. Ordinarily the chemical is fed in a pure state and not as it may occur in food.

"I believe, therefore, what is so direly needed in connection with the testing of foods and the establishment of standards for safety is the development of protocols to test for safety," Mrak said. "We do not have general outlines for procedures for testing for safety, and until they are developed I am afraid we will experience one crisis after another relating to the safety of our foods. Today, industry just does not know what is expected of it, how to proceed, where to go for information or what to do."

Developing suitable protocols is no simple job, though, Mrak said. He predicted years of testing with animals will be required.

For this job, he proposed establishment of a national laboratory, perhaps at the Army Biological Warfare Facility at Pine Bluffs, Ark., which is being closed by Presidential directive. "This is a real possibility if industry will help," he asserted. There might, as well, be a national center for reliable information established, under some prominent chairman and composed of scientists and others of impeccable reputation, to publish facts and dispel misinformation on questions such as pesticide poisonings, he said.

Dr. Julius E. Johnson, director of research for the Dow Chemical Co. and a member of the Mrak commission, supported the need for government protocols for pesticide testing, but he stressed industry should have a voice in how the protocols are drawn. Protocols should be flexible enough to allow individual judgment and they should include provisions for deliberate changes, he said.

Dr. Johnson also recommended government certification of industrial, commercial, university and government laboratories to standardize the adequacy of their personnel, procedures, equipment and facilities and to install public confidence in their findings. Then, he said only toxicological data from certified laboratories should be admitted in support of new chemical products. Second suppliers of pesticides, who enter the market after original patents expire, could be allowed to purchase certified data. Dr. Johnson said, cutting the second supplier's "unfair competitive advantage over the company which has borne the original cost of development.

"Then it would be possible to lay the registration and the tolerance petitions open for inspection and to encourage publication," he said. "Openness of the data at this point would relieve many objections. Today neither the qualified investigator nor the public have access to the facts if they want them, hence the public is suspicious. Moreover the experiment stations, expected to help support the use of a product, do not have access to certain registration information. Experiment stations and extension specialists need confidence in the validity of the back-up information. Moreover, the public official charged with registration and tolerance proceedings is under pressure because the present policy forbids him from making certain information available without the consent of the petitioner. The whole situation promotes public distrust because the supporting facts are not out in the open."

Apologizing to competent pesticide applicators, Mr. Johnson said "one of
the weakest links in the chain is in the diagnosis of pest problems and application of pesticides." These critical tasks often are done by unskilled, poorly paid and non-professional craftsmen, he said.

He suggested some pesticides should be classified for professional use only and restricted from use by anyone but a professionally licensed applicator. Training for such applicators would be provided in agricultural schools, he said.

"The grower would then pay for results and the whole process would be less poundage oriented and more result oriented," he said.

Extension Specialist Bill Harvey of the University of California at Davis offered still more information about herbicides and the environment, concluding "there is no real threat to the environment from the use of herbicides, other than the direct changes in vegetation which we expect from the applications we are making."

Harvey, who is known as "Mr. Weed" for his long association in the field and with the conference, said herbicides have relatively short persistence in the environment under most conditions, and few herbicides are toxic to man or animals.

Problems arise from drift, volatility, leaching and surface movement of herbicides, all of which are well known and usually can be guarded against, he said. "The one we have the most trouble with is drift," he said. "But remember, any herbicide in the environment is far more apt to be a hazard to other plant species than it is to any animal species."

"We need herbicides to change the environment so we can have more food, more fiber, a better place to live and be free of poison oak and some of these other annoying weeds," he concluded.

Harvey concluded. New officers of the California Weed Conference Executive Committee for 1971 are: President—Dell O. Clark, State Department of Agriculture, Sacramento; vice-president—Bryant Washburn, Washburn Agricultural Service, Davis; secretary—Howard Rhodes, California State Polytechnic College, San Luis Obispo; business manager-treasurer—Warren V. Johnson, State Department of Water Resources, Sacramento; directors—Dave Bayer, University of California, Davis, and Paul Houghton, Southern Pacific Transportation Co., Oakland.

Haul your equipment on a Miller Tilt-Top and you can get to work while others are still getting to the job.

When your rolling gear is off and working, Miller's HT tags along to the nursery for a big load of stock or sod. Easy-going suspension provides a gentle ride. Low, wide platform is easy to load machines or material. You get twice the use, twice the value. Get more for your money. Buy the right Miller trailer for your needs. Write for FREE TRAILERING GUIDE.
