Office of Surface Mining Selects Seven Projects for Funding . . . Textron and Jacobsen Sign Sale Agreement . . . Groups Join to Make the Year of the Rose . . . Reclamation Managers Gather in Kentucky for Technological Conference

FEATURES
Small Lake Management and Weed Control
There are specific reasons why some small lakes are prone to aquatic weed problems. Learn how to prevent weed clogged lakes from the construction to treatment stages.

Mulches and Binding Agents for Erosion Control
Virginia Polytechnic's R. E. Blazer compares various mulches for erosion control. Quantities needed, water retention ability, and amount of contamination are three of the areas discussed.

THE LAND RECLAMATION MARKET
The big Green Industry potential may be in the area of reclamation and erosion control. Industry data indicates dramatic growth in this area in the next five years. Read profiles of reclamation efforts by Peabody Coal Co. and Southern Seeding Service.

Trees Suitable for Surface Mined Land
A U.S. Forest Service official spoke on trees to mine officials in Kentucky in May. Weeds Trees & Turf was there to cover his speech and to provide his remarks in this issue.

Industry Advisory Board — Part Three
The state of aquatic plant management and turfgrass entomology are discussed by members of the new Industry Advisory Board.

With its optional 72" mower and 50" wing, the new Gravely GMT 9000 cuts a 9'11" swath, allowing an operator to mow as many as 33 acres in a standard eight-hour day.

But even better than that, the GMT 9000's tight turning radius and the 50" wing enable it to execute a 360° turn, leaving no uncut grass in the circle. As a result, an operator can mow down one side, turn right around and head back the other way without missing a blade of grass in between.

Yet as big and sizeable as the GMT 9000 is, it's also maneuverable enough to cut within an inch of obstacles like fences, shrubs and trees. So you eliminate the need for a lot of costly extra trimming equipment.

Perhaps best of all, besides being able to mow a lot of grass, the new GMT 9000 is designed to keep doing it for a lot of years.

THE STORY OF OUR LIFE.
You see, beneath that impressive rugged exterior, lies an even more impressive interior. Designed to give each and every GMT 9000 a long, lively life.

The exclusive Gravely 8-speed transmission is a good example. The result of years of testing, it delivers the precise speeds and power you need to do a lot of jobs a lot easier. And a lot better.

You get steady power at low ground speeds to handle the muscle jobs. You also get a choice of seven other speeds for mowing, hauling and rapid transit.

What's more, its precision-cut gears run in an oil bath, for less friction and longer life.

MORE POWER TO YOU.
The engine itself is another excellent example. A water-cooled 4-cycle, 4-cylinder brute, it delivers 26 HP at 3200 RPM. The engine has an oil filter and is pressure lubricated. The crankshaft is spheroid cast iron, counter-weighted, running in three replaceable precision bearings.

The cylinder head is aluminum alloy for lighter weight and better heat dissipation. The wet-type cylinder liners also help to dissipate heat.

The result is an engine that is built to last. And last. And last.

HANDLE WITH EASE.
Yet for all the GMT 9000's brute strength, it handles like a pussycat. The instant forward and reverse, by moving one lever, increases maneuverability, reduces operator fatigue. And you have full-time power steering.

Individual wheel brakes improve steering control. In proper locked position they provide a parking brake for the tractor.

The high-back seat is foam-padded, hydraulically-suspended and fully adjustable for individualized operator comfort.

The full instrument panel shows the operator everything from the water temperature, to hours of operation, at a glance.

THINGS ARE TOUGH ALL OVER.
Gravely's all-gear direct drive transmission with a lot of teeth in it.
ELY GMT 9000.
AND THE COMPETITION.

been prone to break, slip or wear out.
WITH ALL YOU CAN ATTACH TO A
GMT 9000, YOU'RE GOING TO
BECOME VERY ATTACHED TO IT.
You've already seen how the 72" mower
and 50" wing attachments make the
GMT 9000 unsurpassed in mowing
efficiency.

What's more, its optional live
and independent
rear PTO and
category 1, 3-point
hitch enable it to
utilize a number
of other attach-
ments as well.

Attachments like plows, cultivators,
carts, sweeper and snowblower. As well
as equipment like a seeder, sprayer, snow
blade, aerator and enclosed cab.

As a result, the GMT 9000 can handle
just about every grounds maintenance
job imaginable.

In addition to building tractors to
last, Gravely wants its attachments to
last, too. That's why most
Gravely attachments are
engineered to be com-
pletely compatible.

IT CUTS COSTS NICELY, TOO.

over most single purpose mowers, a GMT
9000 should result in a lower total cost
ownership in the long run.

And, as you know, Gravelys do run a
long, long time. Which brings us to yet
another important point.

With as well as a Gravely performs,
you won't want to replace it.

With as well as a Gravely is built, you
probably won't have to.

The pivoting front axle is welded steel
construction and comes with rugged
king-pin bushings. Precision bearings
are used at major wear points.

ALL-GEAR DIRECT DRIVE.
The Gravely all-gear direct drive
from engine through the transmission
and to the PTOs vastly improves power
transmission.

And because it's all-gear, it com-
pletely eliminates the bothersome belts
in the power train which have always

How to keep your tractor from
going into hibernation for the winter.

Labor. Good people make your company stand out. Bad people make attempts at quality control fruitless.

The quality of labor today is suffering. Managers complain of an absence of ambition, a seemingly unwarranted hostility toward management, and an unwillingness to accept responsibility.

Labor intensive industries are feeling labor pressure more this year than in past years. Minimum wage legislation, labor reform amendments making union organization easier, and unemployment compensation increases have managers on the defensive. Labor, primarily because of unions, is also on the defensive.

How managers react will play a significant role in the future relationship between managers and labor. That is, if they could react and be heard. Unions are making this nearly impossible.

Unions get in the way of the manager's communication with his workers. Incidents with individual workers are too often taken as attacks on the entire work force. Committees designed for the purpose of resolving individual problems overplay their intended role and become lobbying groups for antimanagement sentiment. Likewise, management often overreacts to union requests assuming a built-in compromise area.

Unions are not the entire problem. It goes much deeper.

Managers of the present are paying penalties for bad management of the past. Short-sightedness still pervades many companies. Top management, unwilling to pay middle managers adequately in salaries and fringes, hires less qualified middle managers. Since it is the middle manager who deals primarily with labor, the resulting poor managers often cause labor unrest.

The middle manager who is good often sees his path to upper management based upon an antilabor stance.

The profit line of short-sighted companies may be higher in the short term, but will not stay there if labor and middle management assume the qualities mentioned at the beginning of this Viewpoint.

Now is the time for management to investigate and institute profit sharing programs for both labor and middle management to obtain the commitment necessary for quality work. This will be the best defense against union entry. Once unions organize in your firm you will slowly lose control of salaries and quality. If you can give a person a piece of the action and a sense of pride, why should he or she join a union?
ORTHENE® Tree and Ornamental Spray has got to be the best insecticide news to sprayers, nurserymen, landscapers and outdoor maintenance people in the last 20 years. It kills many different common insect species, including gypsy moth larvae.

ORTHENE penetrates plant tissue for continuing local systemic action, controlling damaging pests by contact and as they feed on the plant. Because it's absorbed rapidly, there's little chance of losing the chemical to rain. ORTHENE is registered for gypsy moth larvae, bagworms, spring and fall cankerworms on trees and shrubs, California oak moth larvae on oak trees, thrips and aphids on labeled floral crops.

ORTHENE's oral and dermal mammalian toxicity is low (lower than methyl parathion, for example), so it poses significantly reduced hazard, when compared with other insecticides used for the same purpose, to man and the environment. In fact, applicators and field workers can re-enter the fields or greenhouses as soon as the spray deposit has dried. However, ORTHENE must be handled carefully and applied only according to label directions and precautions.

For more information about this remarkable chemical please fill out and mail us the attached coupon. Avoid accidents: For safety, read the entire label including cautions and warnings. Use all chemicals only as directed.
Bison by Satoh
Now Offers Dual Clutch for Live PTO.

Now Bison is even better. For mowing, Grading, Loading. It's the only tractor of its class with live PTO.

So your operators can change speeds without slowing or stopping their implements. The 27-hp Bison handles everything effectively. Thriftily. You pay for just what you need. And you get a tractor that goes where the bigger ones can't.

A wide range of attachments permits year-round use. The 4-cylinder gasoline engine assures quick starts even in cold weather.

Among the features: 2-speed PTO (540 and 1,000 rpm), 6 forward and 2 reverse speeds, Category 1 - 3-point hitch plus attached drawbar, live hydraulics, differential lock, sealed brakes, adjustable wheel spacing, hour meter, full lighting, choice of tire tread, downswept muffler and the list goes on.

Before you make a decision on any tractor, be sure to check out Bison. At 700 dealers throughout the U.S.A. And if you don't know the one nearest you, please write. You'll be glad you did.

RECLAMATION

Kentucky seminar presents latest technology

More than one hundred persons seeking information on mined land reclamation technology gathered at the Madisonville Community College in Madisonville, Kentucky for a field trip and seminar in May. Delegates traveled from Illinois, Ohio, Kentucky and Tennessee, for the two-day educational meeting. Hosted by the College of Engineering of the University of Kentucky and Madisonville Community College, the entourage heard speakers from the U.S. Forest Service, Madisonville Community College, University of Kentucky, AMAX Coal Company, and Peabody Coal Company.

The sessions began Thursday, May 11, with the business meeting of the Council for Surface Mining and Reclamation Research in Appalachia. The major concern was revision of that council's by-laws to broaden horizons, yet limit activities to providing information on vital reclamation techniques and research for those involved.

Dr. Richard Barnhisel, associate professor of agronomy at the University of Kentucky, began the educational sessions by explaining the University of Kentucky's role in reclamation research in Western Kentucky. It includes: land preparation techniques, "ripping" versus smooth grading; the effects of lime and phosphorus on orphaned mined lands; and wood fiber with straw as mulch.

Dr. John Sencindiver, a soil scientist with the Forest Service, showed slides of various mulching experiments he has undertaken and explained the results. He is also concerned with analyzing the benefits of various organic soil amendments for mine reclamation.

Dr. Sencindiver's research has shown that lime and fertilizer, applied on an acid spoil, along with a mulch, will increase vegetative cover.

Mike Ellis, senior reclamation engineer with AMAX Coal Company, talked about using fly ash and sewage sludge in Western Kentucky and Southern Indiana. In one experiment, fly ash was applied to four one-acre plots at a rate of 300 tons per acre. Four different fertilizer rates were used, along with two different seeding rates. Problems immediately cropped up, beginning with incorporation of such a large amount of applied material. The mixture was not homogenous, according to Ellis, and the color was so dark that he felt perhaps enough heat accumulated to damage the emerging seedlings. He also found that the cost of the fly ash far outweighed the advantages and the project was finally dropped.

James Powell, reclamation supervisor-vegetation specialist with the Kentucky division of Peabody Coal Company discussed the research deficiencies of soil reconstruction in land reclamation. Arising out of the new federal regulations and subsequent adoption by states, and mainly in areas classified by the soil conservation service and in the federal register as prime farmland, soil reconstruction presents a dilemma for anyone attempting reclamation. Physical properties, including structure, aggregation, pore space, and bulk density, are going to be affected, probably adversely, during the initial stages of soil reconstruction, Powell said. Compaction will also be a problem, as large machinery necessary to move the soil is employed.

Rufus Allen, U.S. Forest Service, presented data on tree survival on reclamation sites. His research is published in this issue.

Dr. Wayne Rosso, reclamation supervisor and water resource specialist for Peabody, spoke about methods to meet the manganese limits of the new federal surface mining act. Total suspended solids can now be no more than 70 and must average 35 milligrams per liter. The maximum manganese allowed is four milligrams per liter and the average cannot exceed two.

Norman K. Breeding, hydrogeologist in reclamation/mining technology at Madisonville Community College described the use of domestic waste as an erosion control technique in reclaiming mined land.

The Office of Surface Mining was represented by Dr. David Maneval, assistant director, who spoke at the banquet. The federal program will be concerned with such things as blasting, certification, permits, insurance, bonding, and state and federal grants. The current 60 employees will be expanded to 800 a year from now, indicating a significant government interest in mined land reclamation.

TURF

Mower manufacturers urge practical standards

In a special product demonstration recently before the Consumer Product Safety Commission, the lawn mower industry once again urged that any standards developed by the commission avoid restrictive design requirements. It also asked that performance requirement be adopted which would allow manufacturers to develop new technological approaches to protecting users of power lawn mowers.

The commission is in its fifth year of developing a mandatory power mower safety standard. It is not known what effect those standards, once set, would have on larger mowers.

David T. McLaughlin, vice president of the Outdoor Power Equipment Institute and chairman of The Toro Co., Minneapolis, presented the commissioners with a suggested "first draft" of performance language.

JUNE 1978/WEEDS TREES & TURF 9
Mine sites to receive funds chosen

Seven sites where coal mines, long ago abandoned, now cause potential danger or health hazards to nearby residents have been chosen for reclamation by the U.S. Office of Surface Mining, an agency of the Interior Department. The government estimates that these projects will cost about $5 million and the work will be done by coal operators with heavy equipment to repair underground mines and landscape contractors to reseed the land to make it usable again.

Some projects will require both kinds of reclamation. One site is near a school building used to teach 272 elementary and high school students in Scranton, S.D., where subsidence near old mining tunnels has created caverns easily accessible to the youngsters. Work to fill the subsidence and revegetate will take between 15-18 months.

The projects were announced May 16 and will get final approval sometime between mid-June and mid-August. These projects are just the beginning of an ambitious program to reclaim old mines which could easily total $100 million in its first fiscal year. Contractors interested in bidding on the projects, which are located in seven states, can write the Office of Surface Mining for further information. Letters should be addressed to Paul Reeves, assistant director for abandoned mine lands, U.S. Department of the Interior, Washington, D.C., 20240.

California tax cut may help landscapers

Landscape contractors in California should experience an up-turn in business shortly if that state's voters approve a proposed constitutional amendment June 6 that could cut taxes up to $7 billion a year.

The proposal would roll back real estate taxes to 1 percent of the 1975-76 assessed value and would prevent assessments from rising to current market value until the property changed hands. Approval of the proposal, referred to as the Jarvis-Gann amendment, would slash taxes paid by businesses and homeowners.

Such a large cut in taxes would probably have a beneficial effect on landscapers since it's believed much of the money would be used to improve corporate grounds and homeowners lofts. "Hopefully they'll take the extra money and reinvest in their own business and improve the local surroundings," said Joe Brazin, executive secretary for the California Landscape and Irrigation Council, a group of landscape contractors engaged primarily in commercial and industrial work in 13 counties of Southern California. The landscapers hire union employees for their projects.

Denver erosion meeting planned

A symposium on erosion control and revegetation, coupled with an exhibition on equipment and supplies and followed by a two-day tour of reclamation/revegetation projects in the Rocky Mountains has been scheduled from August 1-5 at the Marriott Hotel in Denver, Colo.

The symposium will feature technical programs, including speakers from some of the largest firms engaged in reclamation projects.

The event is co-sponsored by the Associated Landscape Contractors of America and the High Altitude Revegetation Association. Information about the symposium is available from ALCA headquarters, 1750 Old Meadow Rd., McLean, Va. 22101.

"The public interest will not be served by the promulgation of requirements that compel industry to adopt one specific design which increases costs without commensurate benefits, eliminates any element of choice, and retards the incentive to develop new and innovative approaches to lawn mower safety," he told the commission.

The commission is proposing a requirement on future mowers that would include a "deadman control" device. This would shut off power completely or disengage the blade from the power source when the user releases the handle. The commission's staff is considering implementing this device through a blade brake/clutch mechanism.

McLaughlin told the commission that testing by his company indicates that blade/clutch devices presently on the market are not reliable.

Alternative designs addressing the blade contact hazard, which accounts for 68 percent of lawn mower injuries, say the commission, were also demonstrated. They include:

- A conventional walk-behind mower equipped with a control on the handle which requires continuous activation by the operator in order for the unit to run. When the operator releases the control, the blade stops. Starting and stopping controls would also be mounted on the handle.

- A conventional walk-behind mower modified to place the height-of-cut adjustment control in the handle. The unit also includes auxiliary side shields to reduce the possibility of foot contact with the blade.

- A conventional walk-behind mower that incorporates a blade interlock with the discharge chute, as well as an automatic latching mechanism to the discharge chute. The latching system prevents the removal of the grass bag unless the latch is unhinged.

EQUIPMENT

Jacobsen and Textron ink sale agreement

Textron, Inc., of Providence, R.I., has signed an agreement "in principle" with Allegheny Ludlum Industries to purchase Jacobsen Manufacturing and the sale should be completed by the end of May, Jacobsen officials have announced.

Allegheny Ludlum sold the firm so it could use that money to help buy Wilkinson Sword, one Jacobsen dealer said.

EPA officials to see arborists work

A special demonstration, arranged by the National Arborist Association for EPA enforcement officials, will take place in Rockville, Md., on June 7. NAA Executive Secretary Bob Felix said other industries have performed such demonstrations to eliminate any misunderstandings about the application of potentially toxic materials by professionals.

Environmentalists focus on cities

Barbara Blum, deputy administrator of EPA, has challenged the environmental movement to focus on the nation's cities. Speaking to the Sierra Club in Berkeley, Ca., in May, Blum said, "It is the urban environment and urban people who are our most endangered species." Blum recommended the creation of 100,000 new environmentally-related jobs to work on sewage, air pollution, and other city projects. What effect this could have on city landscaping projects and minority business project awards is yet undetermined.

Labor act now up to Senate

Debate on the labor reform act began in the Senate in mid-May, and its effect on the industry at that time was mixed; the bill retained an exemption for agricultural employers, meaning that employees of plant growers, such as those who work growing trees and shrubs, are not allowed to join a union. The negative effect, however, was a fear that other businessmen, such as landscapers, would be much more vulnerable to union-organizing efforts if the bill passes.

Senators opposing the bill were attempting to filibuster and prevent a floor vote when debate began. The bill has passed the House of Representatives, 257-163.

The major concern of industry officials is that, if the bill passes, employers with just a few employees will be the targets of organized labor.

"They (organized labor) are interested in organizing the 'Mom and Pop' shops," said Bob Lederer, executive vice president for the American Association of Nurserymen. Lederer backs up his contention by saying that more than 2,000 union elections in 1976 involved firms with less than 10 employees.

The proposed revisions in the law require employers to hold union elections 15 days after the employees ask for it. Currently, there is no time limit. If the employer fails, the National Labor Relations Board would hold the election.

The proposals call for back pay if a worker is punished for union activities and penalties for employers who violate the orders of the court or labor relations board.

Two maybes, one yes against 2,4-D

EPA officials have indicated that there is little doubt that fetotoxicity is a valid trigger for a RPAR against 2,4-D. Teratogenicity and carcinogenicity are "definite maybes". Conflicting reviews of a study, "Chronic Toxicity of 2,4-D in Rats and Dogs", leave some doubt as to carcinogenicity. The EPA's Carcinogen Assessment Group (CAG) has not reviewed the study, but a consultant has and indicates some positive evidence. The National Cancer Institute found the study did not present convincing evidence.

Roy Beattie, public relations director for Jacobsen, said the impending sale would not effect golf car or other turf equipment sales and service.

TURF

Still no pact on seed burning

No decision has yet been announced on the amount of land that grass seed growers in Oregon will be allowed to burn this year for their 1979 crop.

The U.S. Environmental Protection Agency's regional office in Seattle is trying to determine if the growers can use up to 180,000 acres, the amount they have used in previous years. Environmental groups have opposed that figure, saying particulates from the burning fields create health hazards in Eugene and Springfield and violate the federal government's Clean Air Act.

Dave Nelson, executive secretary for the Oregon Seed Council, has predicted that the quality and quantity of seed for next year will decrease if strict limits are imposed. He has said, however, that the council will take their battle to court if the EPA's decision does not meet their needs.

LAWN CARE

Manufacturers invited to Chicago by group

More than 2,000 lawn and garden manufacturers have been invited to an introductory meeting of the newly-formed Lawn and Garden Manufacturers Association on June 19 and 20 at the Hyatt Regency O'Hare Hotel in Chicago.

A director's reception will be held at 6:30 p.m. June 19. The following day, speakers will give an industry perspective of the association, hear a trade press representative, and talk about the definition and scope of the industry. A three-year plan to develop the association and other long-range goals will be discussed by Sanford J. Hill, the association's executive director.

Some charter members of the new group are Nursery Specialty Products, Seaboard Seed Co., Hesston Manufacturing, Melnor Industries and Plant Marvel.

Association headquarters is at 111 E. Wacker Dr., Chicago, Ill. 60601. The phone number is 312/644-6610.

Thomas C. Atkins was presented the Pennsylvania Nurserymen's Association Nurseryman of the Year Award for 1977 at the PNA Annual Banquet held in conjunction with the 1978 Pennsylvania Nurserymen's and Allied Industry Conference at Pennsylvania State University. The award is presented to the individual who has, through his accomplishments, achieved great strides in advancing the nursery industry in Pennsylvania.

Atkins is currently president of Erb Brothers, a wholesale nursery and landscape firm in Lancaster. He is also serving as chairman of the PNA Research Fund and was co-chairman of the aforementioned conference. He is a registered landscape architect.

Wayne J. Watkins has been appointed sales representative for Rancho Verde Turf Farms. Watkins attended California State Polytechnic University where he studied ornamental horticulture with emphasis on turfgrass management. He also was the recipient of the Southern California Golf Course Superintendent Scholarship for 1977.

David J. Hayes has joined the staff of Great Western Seed Company at their headquarters in Albany, Oregon. Hayes' new capacity will include production, marketing, and new product development, with special emphasis on expanding the company's existing position in the forage seed markets. He had been working as an agronomic consultant throughout the Willamette Valley. Great Western Seed is a wholly-owned subsidiary of Loft's Pedigreed Seed Company of Boundbrook, New Jersey.

William D. Ruckelshaus is the featured speaker at the opening of the Pacific Horticultural Trade Show scheduled for the Anaheim Convention Center in California, September 20-22. Ruckelshaus has served as Federal Administrator of EPA, acting director of the FBI, and deputy attorney general of the United States. He is currently senior vice president of the Weyerhaeuser Company based in Seattle.

Cuyahoga County presiding probate judge Francis J. Talty has announced the appointment of Eleanore B. Kapel to the Cleveland (Ohio) Metroparks System Board of Park Commissioners. Kapel, the wife of northeastern Ohio builder and developer Milan S. Kapel, is actively engaged in the management and operation of Kapel Management which has its headquarters in suburban Euclid, Ohio. She serves as an elected officer and director of several Kapel corporations in Ohio that are involved in real estate, recreation and lodging.

"The appointment of Eleanore B. Kapel to the Metropolitan Park Board is the most recent extension of a long line of services to worthy private and public causes that have characterized her and her family," Judge Talty said in announcing Mrs. Kapel's appointment.

Among the enterprises of Milan S. Kapel is the Berkshire Hills Country Club in Chesterland, Ohio. Because of this personal involvement and activity in golfing, tennis, horseback riding and other outdoor recreation, Mrs. Kapel's prime interest, no doubt, will be the operation and improvement of the Metropark system's six championship and excellent golf courses, plus the nearly 20,000 acres of prime recreational facilities provided by the Parks system in a wide, three-county area.

The Weather-matic Division of Telco Industries has awarded their annual scholarship to Robby D. Layton. The $500 stipend is awarded annually to a park administration major at Texas Tech's School of Horticulture. Layton was chosen because of his excellent scholastic record. He is also active in the student chapter of the American Society of Landscape Architects and has worked summers with park departments in Austin, Texas and Boulder, Colorado.

Deputy Administrator Karl S. Bowers has been named acting administrator of the Federal Highway Administration. He took over the new post following the May 1 resignation of Administrator William M. Cox, who is returning to his home state of Kentucky.

A native of Estill, S.C., Bowers joined the Federal Highway Administration as deputy administrator a year ago after having served three years as the first chairman emeritus (1976) and state highway commissioner with the South Carolina State Highway and Public Transportation Commission. He is a captain in the Air National Guard, and a former judge of Magistrate's Court of Hampton County, S.C.
ARBOTECT® 20-S
The strongest Dutch elm disease protection you can give a tree.

ARBOTECT 20-S fungicide helps make it possible to save many elm trees that otherwise would be lost.

Injected into the trunk of the tree, ARBOTECT builds a barrier against Dutch elm disease inside the tree itself. It helps prevent the disease in healthy elms, and can often save infected trees if they are treated early enough.

Used along with sanitation, insect control, and root graft elimination, ARBOTECT can significantly improve the effectiveness of a Dutch elm disease control program.

ARBOTECT differs from other elm fungicides in several important ways:
- It is registered at rates high enough to be effective.
- It is concentrated, requiring much less water for injection, so trees can be treated much faster.
- Thiabendazole, the unique active ingredient in ARBOTECT, is highly effective against Ceratocystis ulmi, the fungus that causes Dutch elm disease.
- Even though it is more effective and convenient, ARBOTECT costs about the same to use as other elm fungicides.

This year, put ARBOTECT to work in your disease control program. It’s the strongest protection you can give an elm against Dutch elm disease.
MANAGING AQUATIC PLANTS IN SMALL LAKES AND PONDS

Small lakes and ponds make attractive additions to parks, golf courses, commercial landscapes, and private estates. However, it is the role of nature to fill in a body of water with time. Proper maintenance and construction can slow down the process.

Natural lakes through siltation become shallower and thus better growing sites for aquatic weeds. Fertilization of watershed areas for whatever reason encourages growth of vegetation in lakes and ponds. Seepage from sewage treatment systems serves to feed aquatic vegetation. Or perhaps, man has simply entered an area where aquatic vegetation was already established and he wants to eliminate it from his property.

Whatever the cause, any aquatic weed problem cannot be solved without investigation of all the reasons why a small lake or pond has an over-abundance of weeds.

Construction

More than seven million acres of lakes have been constructed on U.S. farms alone. Most of these were constructed under U.S. Department of Agriculture Soil Conservation guidelines. Owners of privately constructed lakes may not have had the benefit of knowledge available to the farmers.

The following points should be considered when building a small lake or altering an existing lake:
—depths less than three ft. should be avoided. Eight to ten ft. is satisfactory for a small lake.
—for each acre of lake surface there should be approximately 15 acres of watershed if the lake is not stream-fed.
—lakes much smaller than one acre do not provide good natural conditions for fish.
—a spillway should be built to control overflow during heavy rains. Lakes with more than 20 acres of watershed per acre of lake surface should have a cement or stone spillway.
—the lake should not be surrounded by tall trees which shade the water surface. Trees should not be planted close to the shore since roots may encourage erosion.
—measures should be taken to prevent wave erosion for lakes in windy locations.
—sand should not be used heavily for lake beaches since it will quickly drift to the bottom causing depth problems.
—loose soil should be avoided in the watershed area to avoid rapid siltation. Siltation should not exceed one percent of the original depth of the lake in one year.
—if there are a number of lakes fed from one stream, it is preferable to branch each lake off the stream, rather than to have one lake feeding into another.
—good air circulation above the lake is needed to mix upper and lower water levels if the lake is not stream-fed.
—aquatic vegetation produces oxygen during photosynthesis and is therefore necessary for good fish production. It also serves to stabilize bottom sediment.
—the lake bottom should be watertight to the degree that serious drops in water level are not experienced in dry weather. Periodic checks for damage by burrowing animals is advisable.

Oxygen content is a crucial factor in lake management. Water holds less dissolved oxygen as it gets warmer. Spring water, although cold, does not carry much oxygen since it has not been exposed to the air. The oxygen content in a lake drops in the summer, especially at lower depths.

A phenomenon called stratification also can occur in the summer. Stratification is the separation of the water into definite layers caused by differences in density as a result of temperature differences. The warmer, less dense, surface layer does not mix with the colder and denser lower layers. Consequently, oxygen does not reach the lower depths of the lake.

Oxygen depletion can also be caused by decay (oxidation) of organic matter in the water. Sewage or organic effluent from livestock can cause severe reduction in oxygen content of the water. Also, lakes near swamps may suffer from an excess of organic matter.

Fish, cold-blooded animals, experience increased respiration as the temperature of the water rises. Consequently, fish use up more oxygen in warmer water. If fish begin to swim at the surface of the lake a serious oxygen problem exists.

Winter presents oxygen problems as well. A thick, snow-covered layer of ice over a lake not
Infestations of aquatic weeds can cause serious drops in land value (far left). Specimen of the submersed watermilfoil (left). The white amur is an exotic species of carp which has great promise for small lake weed control.

only seals out air from the water, but shades the plants under the ice and stops their photosynthesis and oxygen production.

Bubblers and other devices to keep the water layers mixed are available. They can reduce the chance of stratification in the summer and prevent total ice coverage in the winter. Kembro, Inc. makes such a unit.

A small lake should have a natural balance insured by proper maintenance and construction. If it gets out of balance, then the need for a variety of methods to achieve control over aquatic vegetation is evident.

Types of Aquatic Vegetation

Four types of aquatic vegetation are of primary concern in weed control: algae, submergent weeds, emergent weeds, and floating weeds.

Algae are small plant organisms that, when abundant, or in bloom, create an unsightly, smelly, and damaging problem. Algae can clog water filters, irrigation systems, and other machinery. Algal blooms can shade out submerged plants or deplete oxygen dangerously from nighttime respiration. Massive kill-off of other aquatic vegetation can create tremendous amounts of decaying material in a body of water and rob it of its oxygen content. Certain forms of algae are toxic to animals and serve to transmit fish diseases and parasitic infections.

Submergent weeds are rooted in the lake bottom and are totally under water.

Emergent weeds grow in shallow areas with stems and leaves usually out of water.

Floating weeds are either free-floating or bottom-rooted plants which have leaves that float on the water's surface.

Overabundance of any of these plants can interfere with the recreational uses of a lake, speed up the rate of siltation, clog irrigation and drainage systems, cause unpleasant odors, impart a bad taste to the water, crowd out wildlife, and reduce the value of property the lake is on.

Control Measures

Prevention is the first method of aquatic weed control. Regular observation and maintenance of the lake is as critical as any other form of vegetation management. A healthy balance of the aquatic environment should reduce the need for artificial control measures, except for swampy areas where man has entered.

When the lake environment gets out of balance, effective mechanical, biological and chemical means to control weeds are available. Each has particular advantages and disadvantages. In the case of small lakes and ponds, control techniques designed primarily for large lakes are not practical. Attention should be paid not to create a large amount of dead and decaying vegetation in the lake at any one time.

Chemical control of algae is most practical. Application rates should be closely figured and adhered to to avoid any danger to fish. Copper-based compounds, especially in pelleted form, are very useful and are available from a number of manufacturers: 3M Co., Great Lakes Biochemical
Small Lake

Submersed Weeds
- Pondweed
- Hydrilla
- Buttercup
- Cabomba
- Coontail
- Watermilfoil
- Slender naiad
- American Elodea
- Bladderwort

Emergent Weeds
- Arrowhead
- Bullrush
- Cattails
- Water primrose

WEED EATER® GASOLINE TRIMMER/EDGERS.

When they're up against a tough cutting battle, veterans reach for THE ULTIMATE WEAPON: a Weed Eater gas trimmer. For years, these rugged, reliable, and ready-to-go trimmers have engaged the thickest grass, weeds, and brush everywhere. And turned battlegrounds into parade grounds quickly and easily.

There are five different Weed Eater gasoline trimmers. Each armed with a powerful 2-cycle engine. And each is designed with features to complete a variety of grounds maintenance missions. Like the Tap-N-Go line feed on the Model 608. Or the big 4-exit cutting head on the Model 657. Or even the metal blade capabilities on many of the models.

Whatever the mission, Weed Eater gas trimmers will meet the challenge on any battlefront. That's why they're THE ULTIMATE WEAPON. Just ask any veteran.

For a full briefing on Weed Eater gas trimmers, write to:
Weed Eater, Inc., P.O. Box 37347, Houston, TX 77036.
sumes large amounts of aquatic vegetation and does not reproduce successfully in the U.S.

Other natural consumers of aquatic vegetation are crayfish, ducks and geese, other types of fish, snails, and insects.

Chemicals for higher aquatic weeds are applied to the lake bottom after the water level has been drawn down, as granules that sink to the lake bottom, as liquid spray onto the surface, or as a foliar spray. Most chemicals require swimming restriction for a period of time after application. Also, if lake water is used for irrigation, there may be restrictions on use for irrigation. If this is the case, treatment should be avoided in the summer when the demand for irrigation water is greatest.

For submerged weeds the following chemicals are available: Aquazine by Ciba Geigy Corp.; Aquathol and Hydrothol by Pennwalt; Diquat by Ortho Div. of Chevron Chemical Co.; Casoron by Thompson-Hayward; Fenac and 2,4-D by Amchem Products, Inc.; and Systems E and L by 3M.

For emergent weeds the following products are available: Diquat; Dalapon by Dow; Casoron; Weedtrine-D by Applied Biochemists Inc.; and 2,4-D products from Amchem.

For floating weeds there is Aquathol and Diquat.

It is extremely important to read the label of any product and to ask for full information about products from dealers.

Dosages are in pounds per acre-foot. Acre feet are derived by multiplying the surface area of the lake in acres by the average depth in feet. The dealer will also help you make these calculations.

Aquatic weed control is not a simple matter. There are many considerations to be made and questions to ask before going ahead with a weed control program.

Now, rid your lake of unwanted water weeds and algae.

Recreational lakes, ponds and streams are meant to be fun places. Not choked with unwanted water weeds or ugly algae. Now, Pennwalt offers two great aquatic herbicides that clean up these problems—fast and effectively.

Meet Aquathol K® and Hydrothol 191® aquatic herbicides. Aquathol K is available as a liquid or granular. It controls weeds efficiently and quickly. In fact, you can swim in lakes treated with Aquathol K 24 hours after application. And treated water can be used immediately for golf course irrigation without harm to bentgrass turf. Hydrothol 191 does even more. It controls both weeds and algae. And after treatment, there's no waiting period for swimming. Put Aquathol K or Hydrothol 191 to work for you.

For a cleaner, prettier lake.

For more information, contact AGCHEM DIVISION, PENNWALT CORPORATION, 1630 E. SHAW AVE., FRESNO, CALIFORNIA 93710 (209) 226-8400.

All pesticides can be harmful. Read the label carefully and use only as directed.
Mulches and binding agents are used in two ways: 1) for temporary erosion and dust control during construction; and, 2) for simultaneously controlling erosion while seedlings become established. The best way to control erosion is with a plant cover.

For temporary erosion and dust control in construction projects with mulches, it is best to seed a temporary species such as annual ryegrass that will give a temporary vegetative cover. Such a temporary vegetative cover along with mulch is effective and persists longer than mulch-binder combinations.

The only practical way to control water and wind erosion is to establish a vegetative cover as quickly as possible. Success in achieving this depends on four steps.

1) Proper grading of slopes, cuts, and medians. The slopes should be as shallow as possible. Steep cuts should be stairstep graded. The surfaces, except for sandy soils, should be left in a rough, loosened condition for all slopes.

2) The appropriate lime and fertilizer mixture to stimulate desirable, persistent, long lasting species must be applied. It is usually necessary to apply high rates of phosphorus. Soil tests are very helpful in diagnosing the lime and fertilizer needs.

3) Appropriate varieties and seed mixtures are of paramount importance. The components in seed mixtures depend on the slope environment, the climatic region, the soil and rock characteristics, the subsequent mowing management or lack of mowing management, and the season of seeding.

For example, for steep cuts and fills, we design lime and fertilizer practices and seed mixtures to give a vegetative cover quickly from temporary species by using small amounts of annual ryegrass or cereals. Through a series of stages of changing vegetative covers, annual temporary grasses shift to persistent perennial grasses and, finally, persistent, hardy, perennial legumes such as crownvetch, flat pea, sweet pea, or sericea lespedeza dominate over the grasses. The legumes add variable beauty and are very persistent requiring no fertilization nor mowing management. We have legume stands on very infertile subsoil materials that have persisted on cuts and fills for over 20 years without additional attention.

Mulching is a final important factor that helps obtain vegetative cover quickly. Good mulches moderate the soil temperature and encourage water infiltration — these improve moisture content, germination, and seedling growth. Without mulches, the forceful contacts of raindrops with

Excellent germination and seedling growth (above) on a 1:1½ fill slope with a rough, loose surface mulched with 1,500 lbs./acre of woodfiber. A roughened 1:1½ fill slope (right) after applying 3,000 lbs./acre of straw and overseeded with a slurry of seed, fertilizer, and woodfiber at 700 lbs./acre.
soil breaks down the soil particles causing the pore spaces to become plugged with fine sandy and silty materials, thereby causing water runoff and erosion. Thus, with mulches, most of the water will filtrate into the soil to improve moisture for the seedlings.

We find that straw, hay, wood bark, wood chips, and wood fiber are the best kinds of mulches. Wood bark and wood chips are expensive to use because 35-50 cu. yds. are needed per acre, and these materials are usually not available in adequate amounts. Straw is generally a better mulch than wood fiber, but straw can also be a poor mulch if it bears a lot of cereal grains or weed seeds. Hay is comparable to straw mulch, but hay crops are usually contaminated with weeds and undesirable seeds.

I have noticed many seeding failures in highway corridors and in our experiments where we used hay or straw because the aggressive plants of cereal grains or weed seeds in the straw crowded the slow growing persistent perennial grasses and legumes. Later, when the annual cereal plants or weeds die, the soil erodes because desirable perennial grasses and legumes were shaded out.

Wood fiber applied at 1500 pounds per acre (6-12 percent dry matter) has given very satisfactory results during the favorable seeding seasons. Some paper fibers are 30 percent water and must be at higher rates to compensate for the water. Wood fiber and paper fiber are of similar value if applied at the same dry matter rates.

Because wood fiber has no contaminants, it is important to use a companion fast growing species such as annual ryegrass at 5-10 lbs. of seed per acre. During periods of stress, wood fiber at 1500 lbs./acre alone is inferior to straw applied at 3000-4000 pounds per acre. Straw cannot be used on steep 1:1 slopes — with heavy rains it usually flows down the slope, also it is difficult to hold in place. For steep slopes, wood fiber is the best material as it sticks to the soil and holds seed and fertilizer in place.

There is no one mulch best for all situations. The mulching should be tailored to the site. For example, for a lawn, it is very desirable to use wood fiber to avoid weed seed and cereal grain contamination. The best mulch treatment from the standpoint of prolonged control of erosion and ease of application is a combination of 3000 lbs. of straw overseeded with a slurry of fertilizer, seed, and wood fiber by the hydro method. We found that seeding the slurry mixture of mulch seed and fertilizer after applying the straw is as good as a three-step operation: 1) applying the seed and fertilizer; 2) applying the straw; and, 3) applying the wood fiber. Binding 3000 lbs. of straw with 700 lbs. of wood fiber has been a superb mulching combination. This is superior to any of the many binders or tacking agents. The wood fiber binds the straw together and at the same time to the soil; therefore, during late fall and winter seasons, when it is too cold for germination, the mulch lasts a long time and does not blow off. In experiments, a straw mulch with wood fiber as a binder has lasted during the entire winter season on steep 1:1½ slope sites. Asphalt, according to a few of our experiments, is the only chemical material that binds straw together satisfactorily; however, soil contact is poor, so removal by the wind is common.

---

**THEY’VE JOINED THE DIXIE GREEN FAN CLUB**

"I mowed 15 days after sowing Dixie Green® and was on my way to the prettiest putting surface I have ever seen." Bob Martin, Superintendent Clarksdale Country Club, Clarksdale, Mississippi.

"Dixie Green® has given me a uniform, dense putting surface that has putted consistently true. The color has been outstanding . . . even though the temperature in January dropped to 11 degrees F. Bent greens went off color . . . but Dixie Green® came through like a champ." Ed O’Donnell, Superintendent Brook Valley Golf & Country Club, Greenville, North Carolina.

Dixie Green® overseeding mixture is a premier mix of Highlight Chewings-type red fescue which was judged World Champion at the 45th Annual Royal Agricultural Show in Toronto, and Derby turf-type perennial ryegrass. This fine mix has proven a winner for winter-seeding of greens, tees and aprons all over the South. Dixie Green®—a great mixture for you and your members.

Dollar for Dollar — Where quality, performance, and durability count — you can’t beat a Bowie

EXCLUSIVE BOWIE HYDRO-MULCHER FEATURES.

- Only proven unit for both sprigging and seeding with cellulose fiber mulches.
- Equipped with enclosed shredder bar for shredding full bales of cellulose fibers.
- Centralized tower control with no hoses.
- Equipped with triple agitators for faster mixing and eliminating sediment build-up.
- Uses pump only for spraying, so pump lasts longer.
- Slurry passes through pump only once, thus reducing seed damage and clogging.

The revolutionary machine for the turf industry that seeds or sprigs, fertilizes, waters, sprays and mulches in one easy operation.

The BOWIE HYDRO-MULCHER performance is unequaled. Its capability has created a totally new method of lawn, turf and ground cover application, plus faster, more effective erosion control.

If you need a dependable mulcher, then you need THE BOWIE HYDRO-MULCHER.

Call or write for complete details.

The Land Reclamation Market
NOW
YOU CAN HELP CONTROL
FUSARIAUM BLIGHT
WITHOUT COSTLY CHEMICALS

Mother Nature has ways of controlling diseases of grasses that defy scientific explanation. Such is the case in the use of twenty-to-forty percent Citation perennial ryegrass in a mixture with Kentucky bluegrass. Tests made in areas of high Fusarium blight incidence have verified that such mixtures have better withstood the damaging effect of Fusarium blight without the use of costly chemicals. Citation has an attractive dark green color which blends well with Kentucky bluegrass, and in many tests throughout the U.S., mows superior to other perennial ryegrasses.

The above photo was taken of a test plot located in California. The Fusarium blight has devastated the bluegrass stand on the right. On the left, the balanced plant population using twenty percent Citation perennial ryegrass and eighty Kentucky bluegrass is unaffected by the Fusarium. Citation's ability to withstand high temperatures and high humidity helps to maintain a quality turf and balanced plant population during stress conditions. An added plus is Citation's dark green color and improved mowing qualities.

"PROGRESS FROM THE GROUND UP"
GROWTH IN LAND RECLAMATION TO TAKE SIGNIFICANT JUMP

Land reclamation/erosion control could be the BIG Green Industry market of the future. Environmental legislation, especially recent surface mining requirements, are expected to increase dollar volume by nearly 30 percent this year. That is more in one year than experienced in the last five years according to survey respondents in the field. The growth is expected primarily in the area of coal and non-highway public works projects.

WEEDS TREES & TURF polled 1,200 erosion control specialists in the International Erosion Control Association and the Associated Landscape Contractors of America. Ten percent participated in the survey. Respondents included landscape contractors and architects, foresters, engineers, highway maintenance officials, utility personnel, and others.

Respondents indicated their primary types of revegetation work at the moment are highway rights-of-way, parks, residential construction sites, industrial construction sites, and utility work sites. Mining site revegetation is performed by only 27 percent of those responding. Reforestation represents only nine percent of the type of revegetation work performed.

The average percentage of gross revenue derived from erosion control was 31 percent with a median response of 20 percent. Ten percent indicated that erosion control makes up 100 percent of gross revenue.

The average volume of erosion control work done in 1977 was $295,529 with a median of $75,000. We asked also for volume in 1973 and predicted volume for 1978 to get a picture of market growth. The average volume for erosion control in 1973 was $277,380 with a median of $50,000. The predicted average volume for 1978 was $381,934 with a median of $150,000.

It is evident that a much greater jump in erosion control business is expected this year than has been experienced in the past five years. Projecting the average to 1,200, the base for this survey, the market increased from $333 million in 1973 to $355 million in 1977, an increase of $22 million in five years. In 1978, the market is expected to reach $458 million, a jump of $104 million in one year! Furthermore, when asked about the next five years, respondents predicted an average increase in volume of 117 percent, which would place the market at $760 million in 1982. We repeat, these market figures are projected from the average volume of erosion control work done by 1,200 firms.

Surface mine revegetation alone will grow at a fantastic pace with the help of funds received from taxes on mined coal and distributed to states for reclamation projects. An estimated $70 million will be spent this way in 1978. Forty percent expect to benefit from mining legislation.

Two thirds of the respondents said they serve as a revegetation consultant to some degree. They consult primarily for public agencies, general contractors, landscape con-
"My Laval Separators save me over $3,500 every year in labor costs."

Julian Serno, Golf Superintendent
Albuquerque CC, Albuquerque, New Mexico

Sand's no longer a problem in this sprinkler system.

"I had one and sometimes two guys working nearly full-time every day, cleaning sand out of my sprinklers. My ATH control valves wouldn't work at all 'cause of the sand.

"We had settling tanks, but they didn't work worth a damn. So we got Laval Separators. Installed 'em ourselves. They really work good. What more can I say?"

Nothing else gets the sand and grit out like Laval Separators. Up to 98% of all particles as small as 74 microns (200 mesh). No moving parts to wear out. No screens or filter elements to clean or replace. And very little loss of line pressure. Call on us. We won't let sand grind you down.

Laval Separator Corporation
1911 N. Helm, Dept. V-2, P.O. Box 6119
Fresno, CA 93703, (209) 255-1601

Circle 134 on free information card

tractors, utilities and mining companies. Twenty-five percent indicated they work as a consultant for mining operations.

The dominant type of vegetation planted on erodible land by respondents is grass (91 percent). Seventy-three percent plant shrubs and ground covers. Trees are planted by 71 percent.

The erosion control firms in this survey spend and average of $24,834 per year on seed. Using 91 percent of 1,200 (1092) projected with the mean gives an annual expenditure for seed by erosion control firms of $27 million. Other projections put the expenditure for ground covers at $5 million, shrubs at $11.6 million, and trees at $12.4 million. Adding these projections together gives a total annual plant expenditure of nearly $44 million in 1977.

Other annual expenditures projected include:
fertilizer — $18 million herbicides — $12 million mulches — $13 million netting — $2.1 million tackifiers — $2 million pesticides — $1.4 million

Equipment used in erosion control ranges from specialized hydraulic seeders and mulchers to farm equipment such as seed drills and manure spreaders. The survey was limited to the most common types of equipment. The following numbers of equipment are projected for 1,200 erosion control firms:

- tractors — 5,000
dump trucks — 4,200
tank trucks — 2,250
hydraulic seeders and mulchers — 1,200
fork lift vehicles — 1,050
large earth movers — 604

More than 80 percent of the respondents do hydraulic seeding. Ten percent indicated their business is entirely hydraulic seeding work. The average involvement in hydraulic seeding was 38 percent. Twenty-one percent do some form of aerial seeding. It makes up an average of 23 percent of the business for these firms.

Finally, we asked if the respondents were familiar with the Surface Mining Control and Reclamation Act of 1977. About half (49 percent) knew of the Act.

A considerably greater amount of research on the reclamation/erosion control market is needed. We hope to have scratched the surface. Since it appears the volume of business in this area is about to jump significantly, research is needed to help manufacturers meet chemical, equipment and supply needs.

Once again, we'd like to stress the projections in this survey are based upon 1,200 names of firms known to be actively involved in erosion control and reclamation in some form. The associations, sources for the survey respondents, probably represent less than the entire market. We encourage anyone considering erosion control or reclamation work to contact regional and national associations to help the market organize for the most efficient growth based on the latest technology and data.

Regional associations can be contacted through state departments of natural resources. At the moment, the International Erosion Control Association, P.O. Box 807, Freedom, Ca. 95019, appears to have the largest membership in the field. The Associated Landscape Contractors of America, 1750 Old Meadow Rd., McLean, Va. 22101, is also active in reclamation technology.
Mr. Golf, Byron Nelson on Penncross: "Over the years golf course people have tried many types of grasses for greens. In the last ten years, many of the championship courses have produced near perfect putting greens. In my estimation, this is because of the development and wide spread use of Penncross Bentgrass. With good maintenance, it provides a uniform putting surface that putts true and has good color."

It takes a great deal of time and money to build a golf green. Irrigation, drainage and contour are some of the considerations of a great putting surface. The final touch is the type of grass selected for that putting surface. Penncross Creeping Bentgrass is recognized around the world as a superior grass for golf course use. Penncross is more genetically uniform, disease resistant and it establishes quicker than conventional bents. From Palm Desert, California to Anchorage, Alaska, Penncross has proven its climatic adaptability. For that final touch to a great golf green, look to Penncross!
The technology of reclaiming surface-mined land has changed greatly in the last 15 years, primarily because laws have mandated what the technology will be and the laws have changed. In 1977, Congress passed the Surface Mining Control and Reclamation Act and the Office of Surface Mining, Reclamation, and Enforcement was created within the U.S. Department of the Interior. Although final regulations are not complete, anticipation of what they will be has created a surge of interest in reclamation of surface-mined land.

One company that has done an admirable job of adjusting to both state and Federal laws is Peabody Coal Co. of St. Louis, Mo. *WEEDS TREES & SURF* visited Peabody’s Broken Aro mine in east central Ohio for a look at the changes of the past 15 years and the reaction to upcoming Federal requirements.

Reclamation supervisor Earl Murphy, a forester by training who joined Peabody from the Ohio Park Service in 1973, described the latest revegetation work performed at Broken Aro, one of two surface mines owned by Peabody in Ohio.

The difference between revegetation work performed during three separate periods was striking. Reclamation performed prior to 1965 consisted of many small tree-covered hills, many bodies of water and visible high walls. The dense vegetation and craggy terrain offered protection for wildlife inside.

The next method of reclamation, from 1965 to 1972, consisted of striking the tops of spoil piles and planting trees, 900 per acre, and some grass. The most common tree for reclamation has been the black locust.

The third type of reclamation, performed after 1972, consists of gentle rolling hills of grasses and legumes with networks of drainage ditches leading to silt basins. The company that Peabody leases the land from has asked that it be reconstructed to serve as grazing land.

The three-year permit which Peabody has from the state allows mining of approximately 300 acres per year. The mining procedure goes as follows:
- silt basins are constructed
- top foot of soil is removed and stockpiled
—bulldozers cut benches in the sides of hills.
—workmen drill down from the benches, explosives are placed in the holes, and set off to loosen the soil above the coal
—dragline removes spoils, then coal
—spoils are pushed back into the cut by large, double-width blade bulldozers
—spoils are contoured
—topsoil is replaced
—drainage ditches are cut across hillsides which feed into large ditches which lead to the silt basins
—lime and fertilizer are applied.
—seed is either drilled or hydraulically sprayed
—straw mulch is applied with straw thrower
—crimper goes over straw to bind it to the topsoil

According to Ohio law reclamation efforts must be current. This is defined as within 500 ft. of the digging site. Therefore, reclamation is a continuation of the mining process which is not complete until vegetation is back in place.

Murphy devised a system to provide hay and straw for mulching from the grasses planted during reclamation. Although a number of grasses are used, the most common are Kentucky 31 fescue, sweet clover, lespedeza, orchardgrass, and annual and perennial rye. Applying 2½ tons per acre of straw mulch. Murphy hopes to produce most of the 750 tons of straw needed each year.

Lime and fertilizer are applied each spring and fall to the reclaimed areas. Lime is applied originally at six tons per acre. Extra applications may be made based on soil tests taken regularly. The soil is extremely sandy at Broken Aro and mixed with chunks of sandstone. New laws may require all stones larger than six in. be picked up.

Although Murphy doesn’t plant many trees on the latest section of Broken Aro, he uses many trees on Simco Mine, Peabody’s other surface mine under his supervision.

The types of trees he uses are sweetgum, cottonwood, white pine, black locust, European black alder, and autumn olive. Most of the trees are purchased from state nurseries in vast quantities. Murphy mentioned that river birch showed great promise as a tree in reclaimed areas, but the Indiana nursery stopped producing them. Murphy pointed to healthy patches of grass at the base of nitrogen fixing trees. Some mines are considering harvesting trees on reclaimed land to market as pulpwood.

Perhaps the most unique aspect about reclamation at Broken Aro is that the workers doing the planting are employed by the Ohio Mining and Reclamation Association of Columbus. Peabody is one of approximately 100 members of the association which owns the revegetation equipment, hires the man-
The seed that's changing the face of America.

Pennfine Perennial Ryegrass

The biggest breakthrough in the greening of America began in 1970. That's when turfgrass specialists at Pennsylvania State University completed development of a remarkable fine-leaved perennial ryegrass with all the advantages of ryegrass. And none of the drawbacks. They called it Pennfine.

Now, just six years later, the success of their undertaking is evident. On golf courses and athletic fields. In parks and cemeteries. And on public grounds across the country.

Proven in tests. Among the nine perennial ryegrasses tested over a five-year period at University Park, Pennsylvania, Pennfine ranked finest in texture. Most resistant to disease. First in density and decumbency (low growth).

The University Park test results were only the beginning. Over 5,000 test kits with seed samples were distributed over the entire country in answer to requests from turf professionals wanting to test Pennfine. The results confirmed the University Park findings.

Most importantly, Pennfine established a new standard of mowability. Some other perennial ryegrasses, cut with the same mower, left ragged, fibrous tops that quickly turned brown. Pennfine's softer fibers cut smooth and clean.

Proven from coast to coast, from North to South. Pennfine's durable beauty has been demonstrated at prestigious sites all over America. From the lawns at an historic national landmark to the greens at a nationally-renowned golf course.

Besides possessing the ability to stand up under heavy traffic, Pennfine germinates rapidly. That makes it ideal for winter overseeding in the South. And, its non-competitiveness allows a smooth spring transition to bermudagrass.

Proven quality control under the Plant Variety Protection Act. You can be sure that all Pennfine Perennial Ryegrass meets the same high standards, because Pennfine is covered by the Plant Variety Protection Act.

That means every pound of Pennfine is certified. You are assured, by law, that it's produced exactly as intended by the original variety breeder.

Prove it to yourself. To learn more about how Pennfine is changing the face of America—and how it can work for you—write: Pennfine, P.O. Box 923, Minneapolis, MN 55440.
Peabody Coal

power, and offers advice. For this service, Peabody pays OMRA an annual dues based upon tonnage of coal produced and an hourly charge for the workers. The re-vegetation staff of six stays at Broken Aro year-round as does a complete inventory of equipment. Included in the inventory is a Bowie hydraulic seeder, a Finn straw blower, a Brillion seed drill, numerous trucks and tractors.

OMRA is also providing its members with legal assistance on Federal and state reclamation, and is currently lobbying to have air pollution standards adjusted in the state so that Ohio business can burn the high-sulfur coal mined in the state. OMRA works closely with the Ohio Department of Natural Resources which will administer the Federal program when in force. OMRA offers soil and water testing services as well.

Reclamation laws are not perfect, Murphy points out. The requirements discourage removal of coal left in some older mines, since the older reclamation would have to be redone under current standards if part of the older area was re-affected. Prime farm land is the area facing strictest reclamation standards. Complete return of productivity is required within five years of mining. Nevertheless, Murphy remarked, "If you say current, you practically eliminate erosion and productivity problems."

Like many other surface mines, there are occasionally patches where revegetation didn't work. These patches are the greatest challenge of reclamation today. People like Murphy certainly want to understand why such bald areas occur.

Another lingering question is the upward migration of salts from the spoils. Does it occur often? Why? How can it be prevented?

The mystery about revegetation of surface mines should continue until these questions are fully answered. WTT

Conwed economy erosion control netting.

The perfect mate with loose mulches.

Write for the facts. Learn how the strong lightweight plastic netting applied over loose mulch or sod reduces erosion in the toughest spots — ditches, cuts, steep hills. Easy application — 2500' rolls available in 7½', 12', and 15' widths. Cover more than 4/5 of an acre with a roll weighing less than 110 lbs. Conwed erosion control netting slowly disintegrates on the ground.

Write for information on Conwed's complete line of turf establishment products. Write Conwed Corporation, Environmental Products Division, 332 Minnesota Street, P.O. Box 43237, St. Paul, Minnesota 55164 • (612) 221-1144.

WE WROTE THE BOOK ON IRRIGATION

And we've built some diversified equipment along the way. Example: our economical G-Series full or part circle rotary sprinklers with durable ABS housing. Balanced twin nozzle orifices give uniform coverage over 64' to 94' diameters. Celcon® gear train is sealed in lubricant in a self-contained housing and provides smooth, steady, uniform rotation. Rubber covers and vandal resistant screws are available options.

THE TURF IRRIGATION MANUAL

A definitive reference book on landscape irrigation just published by Telsco. Copies may be ordered from the factory.

SOUTHERN SEEDING SERVICE:
35 YEARS IN EROSION CONTROL

Southern Seeding Service, under the supervision of Ralph D. Stout Jr., performs erosion control for highways, industrial sites, utility rights-of-way, airports, golf courses, and water and sewage treatment plants in central and eastern North Carolina. "Anywhere the ground has been disturbed presents an opportunity for our services," says Stout.

The business began in 1942, as Southern Mapping and Engineering Company (Southern Seeding Service succeeded this company) based on a need at that time for erosion control on a number of military installations being constructed over the eastern United States. The men who founded the company were agronomists, farmers and engineers with years of experience in the growing of grass and erosion control. Ralph D. Stout, Sr. headed the company at that time. Along with six employees, using antiquated farm equipment, they seeded and grassed airports, army bases, highways and athletic fields. Most of the work was done by hand.

Southern Seeding Service operates office and warehouse facilities in both Greensboro and Raleigh, North Carolina. Most employees are full time with a year round minimum of twenty on the payroll. Southern Seeding Service currently has five superintendents and twenty operators and laborers using the most modern equipment available.

Southern Seeding's management (l to r): General Superintendent Vance Kirkman, Resident Engineer Bob Harding, and President Ralph Stout Jr.

“At the present time, the company owns two hydroseeders, a Toro unit and a Finn unit, four Finn mulch spreaders, three asphalt distributors, eleven tractors and twenty-three trucks. The trucks range in size from pick-ups to 10-wheel truck-tractors. Additionally, Southern Seeding Service operates twelve truck trailers along with tag-along trailers, and all the required miscellaneous equipment such as tillers, rollers, spreaders, seeders and harrows needed to operate a business like ours.

“We're basically satisfied with this equipment. We use primarily Ford Industrial tractors, Chevrolet trucks, along with several GMC's. We do have another company Classic Landscapes, Ltd. in Raleigh, which is in the commercial maintenance business, and in my opinion, the equipment they are trying to operate the business with is just not properly designed nor constructed to withstand the rigors of commercial maintenance work,” says Stout.

Last year, Southern Seeding Service spent over $140,000 on equipment maintenance. Certain types of maintenance — painting, minor tune-ups and repairs — are done in-house during the winter. Major engine overhaul, transmission replacement, etc., is normally performed by local dealers.

The company owns all its equipment and purchases $50,000 to $75,000 worth a year.

The size of an erosion control project will vary considerably, says Stout. "Some will go as low as $700, some as high as $300,000. We're primarily involved only in establishing the initial vegetation. However, the contracts with the Department of Transportation, here in North Carolina do include maintenance until the job is accepted. "We do some consultant work primarily for industrial sites where we prepare specifications and submit our proposals on same.

"At the present time, we are in the final stages of completing erosion control work on approximately thirty miles of highway between Kinston and New Bern, NC. We had a total of five contracts in this area, two of which have been completed and accepted. Of the three remaining, Robert Merritt is resident engineer on two of the projects and Bob Harding is resident engineer on the third.

"These three project have represented a particular challenge to our people in that when they were bid, they were scheduled for completion in August 1978, November 1978 and December 1978; however, due to the need to get coastal summer traffic on the new road, we have had to re-schedule our men and equipment to complete our portion of the work by the middle of June. When these projects are completed, it will put the traveling public on a four-lane interstate type highway instead of an antiquated two lane road. We are proud of our performance on these projects.

"We spend over two hundred thousand dollars per year on lime, fertilizer, grass seed and the various mulches we use. We use wood cellulose fiber and straw for mulching. The basic agent we use for holding straw is emulsified asphalt. The price is competitive and it's readily available, plus it does a good job for us. I would like to see a material available that would be priced equal and do as good a job but wouldn't be as dirty and hard to handle. We also use a considerable amount of excelsior matting and "Landglas", fiberglas roving.

"Due to the climate in North Carolina most of our jobs here are seeded and there is not much sodding done. We can usually seed, except in the dead of winter, and get
NALQUATIC™
Aquatic Herbicide Carrier

Fight aquatic weeds more effectively by applying herbicide to the weed surface — where it does the most good.

- Easy, fast makeup
- No oils or surfactants needed
- Effective in boat or aircraft applications

At last, an easy-to-use, effective herbicide carrier has been developed for the aquatic weed control specialist. NALQUATIC, a new Nalco visco-elastic carrier, permits the applicator to deliver more herbicide to the submerged weed surface while improving sinking, contact and confinement properties. Applied by boat or air, NALQUATIC causes the herbicide formulation to cling together and stick on the plant surface. NALQUATIC is adaptable to all types of application boats and aircraft and can be fed by inline injection or tank mix.

NALQUATIC should be used according to the following dosages:

FOR BOAT APPLICATIONS

<table>
<thead>
<tr>
<th>Flowing Water</th>
<th>Still Water</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inline Injection or Tank Mix</td>
<td>2 gal/100 gal tank mix applied</td>
</tr>
</tbody>
</table>

FOR AERIAL APPLICATIONS

Add 1½ gallons NALQUATIC per 100 gallons spray mixture. Use D-6 or larger orifice plates.

For complete application instructions and use precautions, refer to the NALQUATIC container label.

reasonable germination. Along the coast, there is some bermudagrass sprigging and beachgrass planting. We've got a job down there, just ready to start, on dune sand that's primarily going to be a sprigging and mulching job.

"We don't see much work coming our way as a result of the Surface Mining Act, mainly because there is not that much mining in the area where we work. We have done some erosion control work for rock quarries; they usually have to take off some overburden, build up a big berm and need to get some erosion control on those areas. We did one job in the mountains for a mica company. They'd had a problem for years, so when we went up and did the work, the newspaper took pictures and wrote it up. We just did our job and Mother Nature took over and made it look good. Sometimes she makes us look bad though.

"The Trade Association that has done the most for us is the Associated Landscape Contractors of America. That's the association for businesses like ours. We also belong to the North Carolina Landscape Contractors Association which really got started as a result of ALCA involvement. Additionally we're national associate members of the Associated General Contractors of America and associate members of the Carolinas Branch of AGC. As far as industry educational programs go, we feel that we find what we need in ALCA's annual meeting and the programs and seminars they sponsor around the country.

"On the one hand, we see business opportunities for us in the next couple of years, however, the Minority Business Enterprise requirements being pushed by the federal government could adversely affect small businesses like ours. Since the majority of our work is subcontract involving federal money participation, general contractors may find themselves in the position of being unable to subcontract erosion control work to us due to having to conform to the quotas being established by the federal government.

One of the greatest things about our country is that people have the opportunity to do the thing they think they can be most successful in but by the same token, I dislike the prospect that the federal government may legislate us out of business by discriminating against us. We have even considered setting up a minority owned business enterprise which would in actuality only be a sham. We are not willing to play that sort of game so, if Southern Seeding Service gets legislated out of business, Uncle Sam is just going to miss a good tax payer.

"The greatest asset of our company is our people. A few years ago, we brought in some younger people who, while they weren't really professionally trained, had the proper attitudes to come in and learn the business. They're our key people in the field right now. Our philosophy is, "You can have all the equipment in the world and you can have all the money to finance it with, but if you haven't got the folks doing the job, forget it, you've got nothing."
And it doesn’t come in a bag or box. Our most valuable product comes driving up to a turf manager’s office...or is in a greenhouse or on a test plot measuring a plant’s progress...or maybe it’s a voice coming over the telephone. You see, ProTurf’s most valuable product comes packaged in our people. It’s the turfgrass experience we’ve gained over the decades...the knowledge we share with our customers.

We have 64 Technical Representatives scattered across the United States and Canada. Their primary responsibility is sales, but most have a degree in agronomy or a related science. They’re turf men. They know the climatic and environmental idiosyncrasies that turf managers in their area have to deal with...and they know how to grow turfgrass under those conditions.

Behind our Tech Reps is Scotts research. There are more than a hundred full time turfgrass researchers on Scotts’ staff. Acres and acres of land in the major climatic zones of the country are devoted to Scotts test plots. And Scotts adds to its own research findings by working in cooperation with extension services and universities. In short, through Scotts research, we have access to a wealth of turfgrass information.

Tying the local ProTurf Tech Rep and Scotts research together on a formal basis is the Professional Turf Institute, PTI. Every winter, PTI conducts well over a hundred seminars throughout the country to share some of the latest technological advances and discuss common turf problems and practices. Literally thousands of turf managers have attended PTI seminars over the years.

ProTurf sells nearly fifty fertilizers, fungicides, herbicides, insecticides, combination fertilizer/pesticide products, seed varieties and blends, and mechanical equipment. Every product in the ProTurf line was designed to help grow healthy, beautiful turfgrass effectively...and economically.

But beyond the physical and chemical properties of our products is always that invaluable ingredient that helps them work that much better...the advice and support our people freely give our customers. It’s something you just can’t put a price tag on.

The new “Little-Big” tractors from John Deere.
Liquid-cooled 22 or 27 PTO hp diesels that are big enough to do all the jobs you need to do. Yet small enough so you can afford them.

If the jobs you have are too big for a lawn and garden tractor and too small for a farm or industrial tractor, John Deere has the tractor you need. In fact, two of them. The new John Deere 850 and 950 Tractors. Rugged. Reliable. And built to handle the jobs you'll give them.

**Big-tractor features.** Under each tractor's lift-up hood is a liquid-cooled, fuel-efficient diesel engine: 22 PTO hp for the 850, 27 PTO hp for the 950. Both tractors have smooth-running transmissions with 8 forward speeds, 2 reverse. Speeds are well-spaced from less than 1 mph for tilling to almost 12 mph for transporting.

Other big-tractor features are standard. There's a differential lock that engages on-the-go for added traction in slippery conditions and a fully shielded 540-rpm rear PTO. Individual rear wheel brakes lock together for highway transport and lock down for parking. A heavy-duty drawbar adjusts to four positions. Hand and foot throttles are both standard. Integral equipment easily attaches to a 3-point hitch (Category 1). The adjustable, fully cushioned seat tilts forward for weather protection.

**Big-tractor versatility.** You can match the 850 and 950 to your jobs. Wheel tread width adjusts front and rear. Ground clearance is nearly 14 inches under the 850—more than 15 inches under the 950. Maneuverability is superb since both tractors will turn within a 10-foot radius. So whether you're mowing, loading, plowing, digging, planting, or cultivating—these tractors can handle the job.

**Service you can count on.** Your John Deere Dealer is always ready to help. Service training schools for the 850 and 950 have already been completed. And a complete inventory of service and replacement parts is ready.

So stop by and see your John Deere Dealer soon for the complete story behind the new "Little-Big" Tractors. Or for free literature write to: John Deere, Box 63, Moline, Illinois 61265.

**Choose from a family of tractor-matched implements for all the jobs you need to do:**

Nothing Runs Like A Deere®
TRENDS IN TREE PLANTING ON MINE RECLAMATION SITES

By Rufus Allen, Research Forester, U.S. Forest Service

The following article is excerpted from a talk given by Mr. Allen at a meeting of the Council for Surface Mining and Reclamation in Appalachia, held in Madisonville, Ky. Mr. Allen joined the staff of the Northeast Regional Forest Research Experiment Station in Berea, Ky., in 1961. He is currently conducting tree planting research on reclaimed surface mines in western Kentucky.

It would appear that after 40 years of research, we in the forest service should know what trees to plant on surface mines and how to plant them. If all we want is trees just to say we have trees, the above statement can be assumed to be true. However, if we are thinking in terms of high-value tree species that will yield a high monetary amount in return, then we're still back in the dark ages.

Many sites have been replanted successfully with Virginia and Loblolly pine and several species of hardwood, namely Black Locust. The Loblolly pine grows well in Kentucky but is apparently subject to ice damage and winter burn from the extreme cold that we've had for the last 2 years. Virginia pine is an excellent pulpwood species, but will there be a market for it when it is matured?

And lastly, what are we going to do with the thousands of acres of Black Locust? Most of the disturbed areas in western Kentucky were hardwood sites, as were most of the disturbed areas in the surrounding states. It is natural then to reclaim these areas to their original status. This has been attempted on many areas over the years. Some of these attempts have been notable successes, others failures, and some just mediocre.

Overall, we have had about a 35% survival rate on hardwood plantations since we started planting hardwood trees several years ago. This rate even extends to our newer studies, recently installed. The notable successes in the past continue to encourage us and to give us hope that we can consistently get good results from present and future plants.

What are some of the problems that face us on getting good survival and growth of trees? Well, first and foremost is the fact that mining spoil is not agricultural or silvicultural soil as we know it. I would say that many of our problems arise from this fact.

I'm going to add another category, biological factors. And under this I have the lack of micro and macro organisms. Not only are these items problems in themselves, but their interaction problems are many. In many cases we don't know the answers because we don't even know the questions. Willis Vogle, our range scientist in Berea (Ky.) has found it necessary to fertilize a site in order to get satisfactory grass and legume growth, but we in the forestry picture have found that, most of the time, the application of nitrogen and phosphorus is detrimental to tree survival, if we apply them at the time of planting. There are studies going on; planting with fertilization before the fact, during the fact and after the fact.

Another subject that affects us is the problem of allelopathy, the toxicity or inhibiting factors of one plant on another. This problem is not new in literature, but it is new to us. At the present time there's only one book on the subject in the English language. Not only are these items problems in themselves, their interrelationships compound our problems.

For instance, we know that some seeds are allelopathic in the absence of microorganisms. We also know that the presence of fescue grass inhibits the germination of some pine seeds. We know that crownvetch inhibits new root growth of year old Red Oak seedlings. The allelopathic role is still not completely understood, but some substances have been identified that apparently are inhibiting agents. One of these is in the realm of phenolic compounds. Interestingly, our research geologist in Berea highly suspects the presence of some phenolic compounds in some spoils that he has analyzed. It is noteworthy to add that the difference between allelopathy and competition is difficult to separate scientifically. These factors that we've just talked about form the basis of our tree planting research in western Kentucky.

The first of our recent plantations was established in 1976 with the cooperation of the Pittsburgh and Midway Mining Company. This study and a subsequent study established in 1977 are much the same. Now we have more variables than we had seasons to plant, so we made up. We used Black Walnut, White Ash, Green Ash, Sycamore, Sweet Gum, Cottonwood, White Oak and Yellow Poplar. We wanted to test some of the seedlings that we've had good luck with in the past and some that we've had back luck with in the past. We also wanted to test tree-grass competition at the same time so we used control plots, fertilizer only plots, fertilizer and legumes, and fertilizer with grass.

And we also used nurse trees as a nitrogen fixer. We used Black Locust, European Black Olive, and we also used both. We substituted for both in 1977. Black Walnut, White Ash, Green Ash, Sycamore, Sweet Gum, Cottonwood, White Oak and Yellow Poplar. We wanted to test some of the seedlings that we've had good luck with in the past and some that we've had back luck with in the past. We also wanted to test tree-grass competition at the same time so we used control plots, fertilizer only plots, fertilizer and legumes, and fertilizer with grass.

And we also used nurse trees as a nitrogen fixer. We used Black Locust, European Black Olive, and we also used both. We substituted for both in 1977. We used Autumn Olive which is also an excellent nitrogen fixer. And of course we had a control of none. We used hardwood bark mulch, with control trees with no mulch and, of course, trees with mulch.

The 1977 study was installed to check the differences in planting years and the possible consequences of different weather conditions. Following the 1976 planting we had an extremely long dry spell, about 6 weeks. We expected the worst. The spring of 1977 was more nearly normal than that of 1976 and we expected better. But you never get what you expect especially in silviculture.

In our study established in 1976 on the P & M land we used White Ash, 1-0 stock and 2-0 stock. We used 2-0 Black Walnut stock. I've never seen such huge 2-0 stock in all my life. No wonder they wanted to get rid of it; they knew they couldn't...
Now... the little big machine...
The Ditch Witch Model 1500!

Ditch Witch introduces the Model 1500... a totally new handlebar trencher design bringing you muscle to match larger equipment... plus new ease and convenience.

- A completely hydrostatic ground drive system... for infinitely variable speeds whether mobiling or trenching. The 1500 is the only handlebar trencher that has it!
- Compact... goes through a standard yard gate. The 1500 is only 35½ inches wide.
- New frame design, effective weight distribution and convenient control placement make the 1500 easier to run than many other trenchers.
- Your choice of 9-, 12- or 14-HP engines.

The 1500 digs trench to 5-foot depths, widths to 12 inches. To really appreciate its new design, you need to see it in action. Call your Ditch Witch dealer for a free job site demonstration. Trees

plant it, so they gave it to us. But the Black Walnut had tap roots about 3 feet long. You're not about to plant something like that in a spoil, so we had to trim down to about 6 inches. All we had left was just a big thick carrot. But look at the survival — 65%. Now we don't know whether that holds true today or not. We're going to check it this fall and we're going to find out. But the 2-0 stock out-survived the 1-0 stock. This was during a year that we had 6 weeks of drought. I think we had exceptional survival.

The 1977 survival came down to about the same again for Green Ash and White Ash. When we combine the species we get a table of trend. This is the trend that has been established over the years. As we look at more and more data this trend falls right along the same lines as what we read. As we get more green ash and White Oak, we get more White Ash and Cottonwood. Yellow Poplar is always, not last, but it's up from the bottom. Black Walnut seems to be a real excellent species to work with. We get extreme variance in our Black Walnut. Sometimes we'll get 2½% survival and sometimes we'll get 65% survival. Why is this? Again, we can't give an answer because we don't even know the questions yet. As we will note from observing the previous survival count, the trend has been established.

Recent studies by Willis Vogle and others show that Sycamore dies back after about five years. Some people's studies will show that Sycamore did real good. Most of the time we found that Sycamore died back and would just come back in the same root stock year after year. Either the leader dies or the entire stem dies.

The only meaningful data on treatment effects that we can glean from our studies at the present time are on mulching and fertilizing. In both years the grass and legumes failed to germinate the first year. So we couldn't use this as an effect. But mulching and fertilizing give a pronounced effect

**1976 study only
*1977 study only

Combining survival for 1976 and 77 begins to show a trend:

Vermeer Tree Spades. Patented tree-moving/tree-packaging machines that automatically dig, ball, transport and replant shrubs and trees up to 25 ft. in height. Tractor-mounted, trailer-mounted, or truck-mounted units—plus complete multi-purpose landscaping machines that handle a tremendous assortment of dirt-handling functions in addition to transplanting trees.

Vermeer Trenchers. Multi-purpose underground machines with a wide variety of money-saving dirt-handling attachments. On tracks or rubber tires. With power ranges from 18 to 195 hp. With digging capacities of 4-36 in. wide, down to 12 ft. deep. Vermeer Vibratory Plows, for installing cable directly underground without damaging finished surfaces or landscapes.

on survival. In both 1976 and 1977 mulching the trees increased survival. In the 1976 and 1977 studies we mulched alternate trees in every row. Evidently mulching helped retain moisture and reduce micro-site temperatures because survival was increased for most species.

We used about a bushel of mulch for every tree. This is about 4 inches thick and reaches out to about 15 inches from the center of the pile or the seedling itself. In the earlier study of 1976 we had used about half this much mulch and, within a year, it had flattened out and almost deteriorated. We can go back to the ones where we used 4 inches of mulch and it does look substantial, even today.

Fertilization

We have found in the past that addition of nitrogen and phosphorous fertilizer has decreased survival. In some studies we have found this decrease to be significant. The decrease in survival, due to...

fertilizer, effects hardwood as well as pine seed. This effect has also been found on whole fields and forest sites as well as surface-mined lands.

Fertilizer rate was 400 pounds of 18-46-0 and 100 pounds of 0-0-60. In an early study on bush lespezedal, the decrease in survival was thought to be from the common phosphate. We found that dicalcium and triple-super phosphates significantly reduced survival. After studying data and survival results from the past several decades, we come to the conclusion that we haven't really increased survival over this period.

We have several thoughts along this line. One thought is that perhaps our planting crews are becoming less efficient. If the crewman is paid by the ceiling, his thoughts are on quantity rather than quality. If he gets paid by the hour and a minimum wage, he thinks he's just doing a job that's not very important. Since our desired end result is good reforestation, tree planting is a very important part of the total picture.

Another thought is of the conditions under which we plant with our present technology, expertise and species adaptation. These are becoming less conducive to survival than they were several decades ago. For instance, studies of 30 years ago showed evidence that survival was greater on ungraded spoil than on spoil compacted by grading machinery. Also, at that time, over-

Put a solo on your back... and save

SOLO's Junior-410 and PORT-493 are the most imitated portable Mist Blowers in the world... but they're still number one! They're your best buy for plant protection and pest control in those hard-to-reach places. They're versatile, too, and precision-engineered to give long trouble-free service.

- Lightweight, corrosion-proof, high-impact contoured frame over steel support
- Famous SOLO easy-start engine; 3- or 5-hp
- Nonmetallic, see-through formula tank
- Weight only 15 or 23 lb
- Center of gravity close to operator's back
- Wide variety of accessories for dusting, seeding, blowing, flame-throwing, granular spreading, ULV application

WEEDS TREES & TURF/JUNE 1978

Circle 112 on free information card
Can Exhalt® 800 cut your fungicide cost in half?

Many turfmen say yes. Our lab tests confirm it. Don't you at least owe it to yourself to spend three minutes reading the story?

For years, fungus disease control has been a source of trouble, frustration and expense. The problem is not the fungicide itself, but the application: how to keep it in place despite torrential rains and irrigation. The problem is wash-off.

That's why the development of Exhalt800 is a milestone of progress in the turf world. Here's the story:

Unlike many sticker-extenders that give little help, Exhalt800 encapsulates every fungicide particle with an armor of protection ... a sticky, flexible "fabric" that clings to turf and foliage, essentially on contact. Yet it flexes and "breathes" to allow normal plant growth.

Because Exhalt800 keeps much of the fungicide in place, even in extreme weather, it can double or triple the control period. Even if it rains an hour after application, you'll still have effective control (see test chart), with less wash-off and less build-up of residue in soil.

Using Exhalt800, you may save 50% or more because you will need fewer sprays, you will use less fungicide with each, and reduce labor costs proportionately. Meanwhile, you can be confident the disease won't flare out of control. The evidence is clear.

In university field tests using leading fungicides, Exhalt800 added to spray tank at minimum-label recommendations gave control equal to higher recommendations without Exhalt800. With higher Exhalt800 dosages, you can double or triple the control period. Results can vary with the kind of fungicide used.

Exhalt800 costs little because it goes far (mix one pint with each 100 gallons in spray tank). Won't damage turf, trees and ornamentals when used as directed. Easy to use: add to spray tank and agitate. Easy clean-up: rinse equipment with water. If frozen in storage, Exhalt800 won't separate; may be thawed and used.

Too good to be true? The question doesn't surprise us. Compared with its competition, Exhalt800 is hard to believe. To know the truth, you should test it. On a golf green. A fairway. On any fungus-infested lawn or foliage.

As an efficient manager, can you ignore the overwhelming evidence? See your Gordon distributor for information, prices and technical assistance.

A closer look at Exhalt® 800 — the reason it works

1) Microscopic particles of fungicide are suspended in water in spray tank.
2) One minute fungicide particle, greatly magnified. Countless millions of such particles in water become the spray solution.
3) Exhalt800 liquid enters spray tank. Hydrophobic (repelled by water), it breaks into a myriad of tiny droplets and attaches to fungicide.
4) Tiny Exhalt800 droplets form a porous, flexible "fabric" that encapsulates each fungicide particle (enlarged to show detail).
5) Turf, when sprayed, becomes coated with millions of fungicide particles, each particle encapsulated within the porous "fabric" of Exhalt800 droplets.
6) Encapsulated fungicide particles on blade of grass (magnified portion). The Exhalt "fabric" around each particle is porous and flexible; it lets plant "breathe", flex and grow, releases fungicide slowly.

Chart shows how Exhalt800 resisted wash-off in a laboratory test. Spray coatings were applied to glass panels and dried 10 minutes at approximately 70° F. Retention after erosion by rain was measured by solvent stripping the panels and determining the residual fungicide by quantitative ultraviolet spectroscopy.

burden removed was not as deep as it is now. Maybe our increase in expertise is just keeping pace with the increase in adverse spoil conditions, hence no net increase in seedling survival.

This spring, with the cooperation of AMAX Coal Company's Ayrgem and Pittsburgh and Midway's Colonial mines, we installed a study that's combined the old with the new. We plowed the planting areas with a disc harrow or chiselplow. We did use both the chisel plow and the disc harrow. We used the chisel plow on P & M Colonial Mine and we had to go with the disc harrow on the Ayrgem mine because there was old log grass that clogged the chisel up and lifted it right out of the ground after about 10 feet. We had to go to the disc harrow to get the job done. After we plowed it once, we plowed it again 90 degrees from the first direction. Then we called on our most experienced personnel to plant with planting hoes and a, I'd say relatively new in design, planting bar.

We also used our tractor with an auger operated from the power takeoff to mechanically dig the planting holes. Half of these holes was backfilled with spoil and the remaining half was backfilled with top soil from a forest. As nearly as possible we simulated the loose spoil conditions of yesterday, along with some of the planting methods, technology, and expertise of today. We did have some problems with the auger. We broke one universal joint and we broke one shear pin. What really gave us a problem was that the point on the end of the auger would hit a small rock right dead center. That rock wouldn't move and neither would the point.

We mulched every other row of trees with hardwood bark mulch and we did not fertilize. We used Black Walnut as a starting species because of its potentially high value and the trouble we've had with survival in the past. We also interplanted Autumn Olive as a nitrogen fixture.

In the past few years much work has been done and knowledge gained in successfully inoculating the seedlings with mycorrhiza. Most hardwoods have endomycorrhizal associates rather than ectomycorrhizal. The research of endomycorrhiza is much different, more difficult. The isolation, growth, inoculation, testing and reinoculation of species is time consuming. Ectomycorrhiza has visible and collectible spore forms. On the other hand, most of the endomycorrhiza have no visible or collectible spore forms and is not evident on visible inspection of the roots.

Our microbiologist at Berea has been attempting to isolate endomycorrhiza from high value hardwoods grown in a natural forest in the nursery and on surface mine plantations. At present he is growing these associates in quantity for inoculation. In the spring of 1979 we hope to install a study in the western coal fields with hardwoods inoculated with different endomycorrhizal fungi. Our last study concerns planting methods. We have a hundred extra Black Walnut trees that we can sacrifice each year and study their roots for mycorrhiza and their tops for nutrient growth and the presence of essential nutrients and toxic elements.
Dr. A. J. Turgeon and co-workers J. E. Haley and J. R. Street conducted intensive Kentucky bluegrass cultivar management studies. Twenty-one cultivars were planted in September 74. Varying management regimes were imposed to measure their competitiveness against the infestation of Poa annua.

They concluded: "The most impressive differences among cultivars were observed under close mowing (0.75”) and high fertilization (8 lb./N per 1000 sq. ft.). Several of the cultivars were virtually overrun by Annual bluegrass while others remained nearly weed free. Those cultivars which are apparently best adapted to this cultural intensity include A34, Brunswick and Touchdown".

Touchdown fights Poa annua two ways: First — its superior disease resistance means it won’t thin out from Crown rot (Leaf spot) Leaf rust, Stripe smut or today’s Fusarium so Poa can’t get a foothold . . . and secondly it’s so aggressive and dense in growth habit it just keeps on fighting Poa.

Touchdown is ideal for overseeding . . . it germinates fast and quickly develops a healthy, mature turf.

Let's look again at what Touchdown has for you:

- early spring greenup
- rapid establishment
- drought and heat tolerant
- dwarf growth habit
- superior disease resistance
- bright green color

ABILITY TO CHANGE, RESEARCH ARE VITAL ACCORDING TO BOARD

Alva P. Burkhalter, Ph.D.

Dr. Burkhalter is chief of the Bureau of Aquatic Plant Research and Control in Tallahassee, a division of the Florida Department of Natural Resources.

Burkhalter received his Ph.D. in plant physiology from Auburn University in 1970. His B.S. in forestry and M.S. in genetics were earned at the University of Georgia.

Burkhalter’s latest research explores the use of the white amur for aquatic weed control in landlocked lakes used for irrigation. The exotic fish is banned in many states for fear of its effect on the ecological balance of the aquatic environment. Burkhalter thinks research on the fish will dispel such fears and legalize use of the fish in more states.

Burkhalter is a member of the Weed Science Society of America, the Aquatic Plant Management Society, (APMS), and is a past president of the Florida Chapter of APMS. Hobbies include hunting, fishing, guitar, banjo, golf, and basketball.

Aquatic Plant Management — the science, profession and the problems — is still in the early stages of development. Compared to childhood, it would now be in its rapidly expanding and growing adolescent years.

The science of Aquatic Plant Control has developed as a branch or support function of many other major areas. Its earliest function was to assist commercial efforts by controlling plants that caused problems to navigation. From here it has expanded to other areas of concern — Fish and Wildlife, Public Health (Mosquito Control), agricultural irrigation and potable waters.

With the growing population of our nation and the increased emphasis on multiple usage of water, the aquatic plant managers of today must understand the various facets of aquatic plant control and how they differ, while at the same time relate to each other. This is becoming increasingly important because water used today for one purpose may be used tomorrow for another.

Aquatic plant problems are generally directly attributable to man’s activities as he progresses. Man’s increased mobility and world traveling have led to the introduction of exotic noxious aquatic plants that now plague many of our waterways. His pollution either from industrial, agricultural or domestic waste often provides excessive food stuff for their growth and mans designated usages of waters and conservation practices (navigation, irrigation, etc.) often mean that even the native plants that were heretofore no problem have subsequently become a problem in these types of waters.

Current trends in control necessitate that the aquatic plant manager of today be a “jack of all trades.” Early aquatic plant control centers mainly on the use of machines of which similar methods are still used today. The most commonly used method of control at present is chemical, but rapid development is taking place in the area of biological control. Therefore, the managers of today must be part engineer, chemist, and biologist, and adapt rapidly as changes take place.

The nature of the problems are also rapidly changing. Early plant problems centered around floating and emergent species such as water hyacinth and alligatorweed, but submerged plants, such as Eurasian watermilfoil and hydrilla, are posing greater threats.

In summary, aquatic plant problems and control technology are rapidly changing, the future of aquatic plant management belongs to individuals who will do likewise.

Harry D. Niemczyk, Ph.D.

Dr. Niemczyk is Professor of Entomology for the Ohio Agricultural Research and Development Center in Wooster, a research facility of Ohio State University. He is also a consultant for Chem-Lawn Corp.

Niemczyk’s research centers on insects of turf. Two examples of his research are the life cycle of the ataenius beetle and the characteristics of the winter grain mite. Both pests are not found on any registered pesticide label even though they can cause significant damage to turf. Niemczyk is working to collect information to make registration of pesticides for these minor pests more likely.

Niemczyk received his Ph.D. from Michigan State University. In 1974, he was presented with the Ohio Turfgrass Foundation Professional Excellence Award. He is a member of the Entomological Society of America, the American Society of Agronomy, the International Turfgrass Society, and the Ohio Turfgrass Foundation.

An ardent fisherman, Niemczyk often returns to Michigan with his wife and four children to fish for steelhead.

The single most significant event in turfgrass entomology was the labeling of DDT and later the chlorinated cyclodiene insecticides (aldrin, dieldrin, heptachlor, chlordane) for control of turf insects and, in the case of chlordane, crabgrass.
The Musser Foundation . . .  
An Investment in the Future

We are a non-profit, tax-exempt, charitable and educational, IRS approved corporation. We are building a fund that perpetually will create income which will be used through graduate fellowships to train and educate leaders in the turfgrass field who will fill vacancies created when our active scientists retire. For some of our top leaders that time is NOW! Fellowships involve closely supervised original basic research at a recognized experiment station and the writing of a learned thesis.

Our officers, directors and advisers are qualified to offer assistance in several categories:

- **Benefit Tournaments** can be structured to help state experiment station research as well as MITF.
- **Memorial Funds** honor the dead with a Living Fund that supports higher education in turfgrass forever. Several currently are in existence.
- **Trusts** can be developed by our specialists to benefit both the donor and MITF.

Contributions always are welcome in any amount. Donations will be gratefully acknowledged and the donor’s name will be permanently inscribed on the Fellowship rolls.

For further information please fill out the coupon below.

Mail to: Mr. Ben O. Warren, Treasurer, 8400 W. 111th St., Palos Hills, IL. 60465.

These compounds were used successfully for many years. In fact, they were so successful that research on turf insects declined at universities and agricultural experiment stations. The importance of insects in turfgrass management courses also declined in turf schools.

Another significant event occurred in the early 1960's when an instrument known as the gas chromatograph (GLC) was developed. The GLC provided the capability of measuring pesticide residues in parts per million. This sophisticated instrument was to have a major impact on the use of all pesticides. With the GLC we soon learned that DDT and the chlorinated cyclodienes left unacceptable residues in the environment, including the food chain. Paradoxically, the major advantageous characteristic of these compounds, long residual activity, ultimately led to their demise.

The residual characteristics of these insecticides led to other problems. Among the more serious was the development of insect strains resistant to them.

With the removal of aldrin, dieldrin, and heptachlor from use in the early 1970's and, more recently, chlordane, the few remaining turf research entomologists recognized the need to conduct research designed to provide substitutes for these insecticides. Their efforts, together with those of the chemical industry, led to the labelling of the organophosphates, diazinon, chloropyrifos (dursban®), and trichlorfon (Dylox®-Proxol®) for grubs and other insect pests. While these insecticides generally provide good control of chinchbug, sod webworm and other pests that inhabit the turf surface and thatch, they frequently provide only fair control of grubs that inhabit the soil. We now know that among the factors limiting their effectiveness against soil pests is the fact that the insecticide can be bound to the thatch before it reaches the target pest. Another major factor is that consumers are unaccustomed to using short residual insecticides, and therefore do not properly follow required irrigation and other procedures to immediately move the insecticide to the target.

Loss of the chlorinated cyclodiene insecticides means shifting from the "spread it and forget it" philosophy long associated with these compounds, to one of "reach the target pest NOW" necessary with organophosphates. This causes many problems. For the consumer it places new emphasis on the need for safety. It also means more attention must be given to rates and uniform distribution of the product. Proper distribution of liquid insecticides requires higher volumes of water than are
used for fungicides or herbicides, and few golf courses have equipment to apply granular insecticides properly. Applications must also be accurately timed because the long residual activity is not there to ‘eventually’ control the pest.

Now, more than ever before, the consumer must have knowledge of the target pest’s life cycle. Many still do not understand why this is necessary when the objective is to kill the pest, not study it. The answer, of course, is that the life history points out when the insect is most vulnerable to control and therefore sets the time of application. Without that knowledge treatment timing is a guess.

The change in philosophy and need for new knowledge requires additional training. Unfortunately, extension entomology in most states is overburdened and does not have adequate personnel to provide the specific training turf managers and other consumers need. Frequently, the turf specialist, who is likely an agronomist or a horticulturist, finds himself called upon for such input. Since most of these specialists have had little or no formal training in entomology or insecticides and their use, the information communicated to the consumer can be inadequate and sometimes inaccurate. The need for extension entomologists and others with professional knowledge of turf insects and the principles of their control must be made known before the consumer’s needs for information can be met properly.

The shift from long residual to short residual insecticides for control of insect pests of turf has clearly identified that more research is needed in turfgrass entomology. While most states have an agronomist or horticulturist doing research on the agronomic aspects of turf, there are about five turf research entomologists in the U.S. Little or no research has been done on control of recently “discovered” pests like the greenbug aphid and winter grain mite. With so few researchers it will be some time before information needed to form the basis for labelling controls for these pests can be developed. We must know more about such important matters as: (1) the duration of the residual effectiveness of insecticides currently in use; (2) the susceptibility or resistance of present turfgrass varieties and strains to insect injury; (3) the physical, chemical, and biological factors relating to the movement of insecticides through thatch; and (4) cross resistance characteristics of the southern chinchbug resistance to certain organophosphate insecticides ... just to name a few.

In summary, the future requires more emphasis on research and extension in turfgrass entomology. Research must show how we can best use the insecticides and management practices we now have to accomplish control of turf pests. New compounds for turf insect control are simply not currently being developed, and prospects for the future look equally dim.

Virtually every segment of the turfgrass industry is in serious need of a basic foundation in the principles of dealing with today’s insect problems. The state extension services and the industry must rise to meet this challenge by seeking people with professional expertise to communicate the needed information. If such people are not available, then let the need be known so we can begin training them now.
For more information on how to cut out fungi diseases in turf and ornamentals.

Your turf and ornamentals need moisture to survive. However, wet weather brings out the worst in your soil. Fungi diseases like damping-off, blight and rot. Diseases that can stunt or weaken your plants.

Terraclor® and Terrazole® soil fungicides protect the value and beauty of your turf and ornamentals. Give you healthier, stronger plants, that are more beautiful.

Get Terraclor or Terrazole from your local chemical supplier. For more information cut out and mail the coupon.

Terraclor® soil fungicide

HYDRAHAUL, an “all-in-one” utility vehicle now available from Ome, has an aluminum body and independent power source. The hydrostatic transmission changes from forward to reverse with a shift in foot pressure. It has no gears to shift, no clutches, and no belts to break, according to Ome. The all aluminum, hydraulic dump bed and fenders will never rust.

The unit also incorporates a 3000-watt A.C. power source generated from the truck's engine that will allow operation of a variety of electrical tools from the 110-volt power source.

Circle 701 on free information card

TERSAN 1991, a product of E.I. Du Pont de Nemours, is now available in a water-soluble package. The convenient package goes into solution in minutes without any direct user-exposure to the fungicide from measuring and handling. Three 1/2 lb. soluble packets are packed into each 1.5 lb. bag. Quantities of the soluble packet will be limited this season, according to Du Pont. They recommend Tersan 1991 for the control of turf diseases, including dollar spot, large brown patch, Fusarium blight and stripe smut.

Circle 702 on free information card

MINIBRUTE is claimed to be the first...
12-volt battery-powered chain saw by Tensen Company. Operation is simple, according to Tensen. The battery clips of the saw's power cable are attached to any 12-volt automotive battery and the saw is ready to go. Minibrute has an all-metal seven pound powerhead with a 20-ft. power cable and 14-in. sprocket nose bar. The power output is 985 watts. The saw only uses power when it is cutting. Tensen claims most automotive batteries have power enough to cut a pick up load of wood.

Circle 703 on free information card

THE TRACKER, a detection system designed for locating water pipes, conduit, sewer pipes, and PVC water pipes that have water in them, has been introduced by Progressive Electronics. The system consists of a transmitter with clip-type connectors and a 33-in. tracking unit weighing less than three pounds. Each unit operates on a nine-volt battery.

Features, according to Progressive Electronics, include: aluminum construction with protected, water resistant receiver; easy-to-read meter for accurate tracking; optional headphones for hearing the tone; fingertip control for maximum sensitivity; normal operation on dead or active lines up to 480 volts; no earth grounds required and one hand operation.

The Tracker can also be used to trace opens and shorts to ground in buried, covered or sheathed wires or cables as well as cable path.

Q: What grass species have trouble growing in heavily shaded areas?

A: None of the common turfgrasses are adapted to heavily shaded areas although some will tolerate more shade than others. In the northern states, the most common turfgrass with poor shade tolerance is Kentucky bluegrass (Poa pratensis L.), although a few improved cultivars will tolerate up to 65% shade. In the South, Bermudagrass (Cynodon L. C. Rich) displays the least shade tolerance. Conversely, the most common turfgrass species with good shade tolerance in the North is red fescue (Festuca rubra L.), and, in the South, is St. Augustine [Stenotaphrum secundatum [Walt.]Kuntze].

Q: Is there any product other than Endothall for control of veronica?

A: If you are concerned with the control of veronica in an established lawn, both Silvex and Trimec (2,4-D + MCPP + Dicamba) will give good control when the weeds are actively growing. Check the labels to see if either of these herbicides is recommended for your particular turfgrass.

Q: I seem to have some difficulty obtaining good control with my webworm spray. By good, I mean lasting control. I have used Diazinon and Sevin, but in some cases, when I check a couple or three weeks later, new webs have appeared. Is there any other material that offers longer residual?

A: There is no insecticide labeled for webworm control that gives longer residual than Sevin or Diazinon. However, you should not be observing new webs within three weeks of an application of either chemical. Perhaps you are applying too early, before all of the eggs have hatched. Also, be sure you have sufficient pressure to penetrate the webs with your spray.

Q: When is the latest date to apply a crabgrass control?

A: Crabgrass control is best achieved by pre-emergent herbicides that must be applied before the seeds germinate. The latest date is dictated by your climatic region and local weather conditions. Crabgrass seeds germinate when the temperature of the top one inch of soil stabilizes above 55° F. (about two weeks after soil first reaches 55° F.), which may vary as much as six weeks from one year to the next.

The spring flowering shrub, forsythia, is a fairly good indication of conditions for crabgrass germination. Your pregermination herbicide should be applied by the time forsythia bloom drop occurs.

One application should be sufficient unless you are in an area that also is plagued with silver crabgrass (goosegrass).

Q: How much value to lawns and shrubbery are the expensive foliar nutrients? Is the cost worth any advantage?

A: I would not pay a premium price for foliar fertilizers unless the plant was not responding to soil-applied fertilizers. Any soluble fertilizer can be used for foliar fertilization and the runoff can be absorbed by the root system. The real benefit of foliar fertilization is in providing nutrients to the plant when the roots have been injured or when soil conditions — primarily improper pH — prevents the availability and absorption of soil nutrients. This is particularly a problem with micronutrients such as iron, manganese and zinc in alkaline soils.

Q: Please recommend trees that can be grown in extremely wet soils.

A: Following is a list of trees which thrive in very wet soil:

**Deciduous**

- Acer dasyacarpum
- negundo
- rubrum
- Alnus glutinosa
- Betula lutea
- nigra
- populi folia
- Carpinus caroliniana
- Carya ovata
- Fraxinus caroliniana
- lanceolata
- Gleditsia aquatica
- Larix americana
- Liquidambar styraciflua
- Magnolia glauca
- Nyssa sylvatica
- Platanus occidentalis
- Populus balsamifera
- grandidentata
- Quercus bicolor
- palustris
- phellodendron
- Salix alba
- babylonica
- fragilis
- nigra
- pentandra
- vitellina
- Taxodium distichum
- Tilia americana

**Evergreen**

Weeds Trees & Turf
Box 6049
Duluth, Minnesota 55806
Here’s the 72” out-front rotary mower that doesn’t slip and slide all over side slopes.

When we designed this Jacobsen out-front commercial, we knew it could do all of the things we wanted it to.

Like mow up to 30 acres a day. Climb up and down curbs. Trim tight around trees. And with optional accessories, it can mulch leaves, plow snow or blow snow. And even sweep.

The trick was to distribute the weight so it would grip the turf with all six wheels when angling along side slopes.

Front wheels support cutter deck for super stability.

That’s why the cutting deck is mounted on the carrier, with the two front wheels supporting it. This design keeps the rear wheels from lifting, and makes the Jacobsen the most stable out-front rotary on the market.

Not only that, the weight on the drive wheels can be adjusted for different terrain conditions. For reliable traction.

This Jacobsen out-front rotary meets the tough power mower safety standards of the American National Standards Institute, Inc. (ANSI). No mean feat in itself.

Can perform zero turning radius, trims like a small mower.

We suggest you ask your Jacobsen distributor for a demonstration of this superbly designed mower-trimmer-mulcher-sweeper-snow blower-plow-combination-miracle-machine.

It’s the one that digs in on side slopes.

Jacobsen Manufacturing Company, Racine, Wisconsin 53403

Jacobsen
An Allegheny Ludlum Industries Company

Take a look at leadership.
Q. We plan to rebuild some tees — what should we consider? H.M., Bedford, In.

A. You should consider: (1) the number of rounds of golf played each year, (2) where the building material will come from, (3) who will do the rebuilding, (4) the possibility of incurred liability if you change the tee angle or position, (5) the time of year, and (6) the turfgrass that will provide the tee surface. This list is by no means comprehensive, but it should answer most of your questions.

First, the number of rounds of golf you anticipate will be played each year will help determine the size of your new tees. (In the northern latitudes about 40,000 rounds a year is a very busy golf course whereas in more moderate climates it is not unusual to play two to three times that amount.) The rule of thumb is to allow 150 sq. ft. for every 1,000 rounds on a wood shot hole and 200 sq. ft. per 1,000 on an iron shot hole. This means on a course playing 40,000 rounds per year, the tee on a course playing 40,000 rounds per year, the tee on a wood shot hole should be 150 sq. ft. x 40 = 6,000 sq. ft. and 8,000 sq. ft. on an iron shot hole.

Naturally this figure reaches a limit of practicality no matter how many rounds are played a year and it is a maximum of about 10,000 sq. ft. This figure refers to usable space with normal soil conditions, so that the injured turf can have time to heal itself.

Many superintendents either do not have the luxury of space to build such large tees, or do not wish to maintain such large areas during the healing process and prefer a tee surface that permits more intensive management to accelerate recovery. Thus, when building or rebuilding tees they have chosen to employ a U.S.G.A. type construction or a PURR-Wick system. Although much more expensive to build than a soil tee their performance is superior. Others who do not have the money to build such sophisticated systems have simply optioned to incorporate about 60 percent sand into the topsoil to increase the resistance to compaction, to improve internal air and water spaces, and to encourage deeper rooting and hence stronger turf plants.

It is normally recommended that a tee have a slight crown in the middle of about 6 in. on a 60 ft. wide tee to give some surface drainage.

The second consideration in rebuilding tees is where the building material comes from. (I am of course assuming that the tee will be elevated above the existing terrain to provide it with surface drainage, give the tee definition, and improve the visual presentation of the hole.) If the material is to be trucked in, there is the resulting damage from the trucks and the increased chance of differential settling resulting from the condition of the fill material (composition and consistency) not to mention the possibility of widely varying chemical or physical properties unless taken from the same source. If the material is available on the property, not only will its cost be less and its response be more predictable, but also it may allow for moving the fill during dry periods with less damage to the turf and as men and resources are available. Usually fill material will settle 15 percent of its depth but since this is so unpredictable it is suggested to place the fill in the proposed location in the dry season, assuming it does not adversely affect play patterns, and allow it to settle over the rainy season.

Who does the rebuilding of the tees will influence not only the cost but also the scope of the rebuilding. A professional golf course contractor is the best buy but funds may dictate that you must subcontract the work or do it yourself. A golf course contractor has the special equipment and operators to quickly and efficiently do any size job so that the turf is either sodded or planted with maximum establishment time and with the highest quality.

A book could be written about the assumed liability that a club takes on when ever they change the tee location or playing angle. Since safety to other golfers is paramount and neglect of safety leads to law suits, one must be careful about the proper siting of a tee. It is a well known fact that 80 percent of golfers slice the ball and the play emphasis is to the right. To neglect this fact and other such information and place a golf feature in unsafe position is a risk too great to ignore. If any change in play pattern may result from a tee relocation, it is strongly suggested that a competent golf course designer be retained for the project. A list of golf course designers is available from the American Society of Golf Course Architects, 221 N LaSalle Street, Chicago, Illinois 60601 or from The National Golf Foundation, 200 Castlewood Drive, North Palm Beach, Fla., 33408.

The time of year that the tees are to be rebuilt is a consideration, especially if the new tees will occupy the exact position of the old ones. Since few golfers want to play from poorly conditioned or temporary tees, new tees should have 6-8 weeks of good growing weather after seeding, sodding or sprigging to establish a strong, tightly knitted sward. Therefore in northern climates the ideal starting date is just after Labor Day and in bermuda grass areas it is early to mid May. Consider your manpower, normal maintenance, irrigation needs, and weather of these periods if you intend to rebuild them yourself.

Since 20 percent of golf shots are played from the tees (by the average golfer), with a turf damaging golf swing, it is reasonable that the tees should not only be as large as possible but also have the best turf quality. Therefore it is recommended that the very best cultivar or blend of cultivars be selected and used, for the cost increase will be small compared to the maintenance savings. All things being equal using the most aggressive varieties for wound healing is a very important consideration.

You asked me for the time and I told you how to build a watch, but rebuilding tees should be considered a major construction project.
DURSBAN* Insecticide
Will Treat 1000 Square Feet of Turf for Around Half a Buck.

That's less money than most other turf insecticides. In most cases, a lot less. And it lasts a lot longer, too. So if you have a lot of area to cover, go with the proven performance of DURSBAN* 2E Insecticide and the double-strength formulation DURSBAN 4E Insecticide. They're the effective, economical way to do away with common turf pests.

You see, DURSBAN Insecticides are carefully formulated to provide broad spectrum, multi-purpose control of cutworms, chinchbugs, sod webworms and numerous other turf pests, plus ornamental plant pests and mosquitos. They kill turf pests two ways: by contact and ingestion.

And DURSBAN Insecticides give unsurpassed residual control of all surface turf insects. Which means they work longer. And that saves you time, saves you trips. And that's money to you.

Add up the benefits and you'll see why the pros in the industry choose DURSBAN 2E and double-strength DURSBAN 4E Insecticides two-to-one over the nearest competitor.

Make DURSBAN Insecticides part of your turf program. Just be sure to read and follow all label directions and precautions. Agricultural Products Department, Midland, MI 48640.
HELP WANTED

SALES POSITIONS: Aggressive and fast-growing western New York tree-care company is looking for two (2) experienced, intelligent, and aggressive salesmen. Commercial salesman with experience in right-of-way, and clearing and grubbing estimating. Private salesman with experience in residential tree and landscape sales. Salary, benefits and working conditions are exceptional. Send complete resume and personal data (all to be kept confidential) to Robert Hooper, Monroe Tree & Landscape, Inc., 225 Ballantyne Road, Rochester, New York 14623.

PARKS ARBORIST — St. Louis County, Missouri. Responsible for directing the operations of the forestry, nursery and greenhouse crews in a parks system consisting of 58 parks totalling 6,800 acres. Applicants should have Bachelor's Degree in Forestry, Horticulture or related field, and considerable experience in forestry, nursery, and greenhouse operations. Salary range $13,671 to $17,665. Apply to St. Louis County Division of Personnel, 7900 Forsyth, Clayton, Missouri 63105, telephone (314) 889-2429. Equal opportunity employer M/F.

NAA ARBORIST seeking working foreman in Huntington, Long Island. Must have knowledge of equipment, good tree-man and experience in handling a crew. Opportunity to become a manager. Send resume to Conservation Control Corp., 477 West Main Street, Huntington, N.Y. 11743 or call 516 271-2998.

POSITION WANTED

POSITION WANTED — 13 years landscape maintenance, B.S. Horticulture, 11 years supervision, desire municipal or private park system management position, certified pesticide applicator. Phillip A. Winters, 4700 Whitestone Drive, Richmond, Virginia 23234.

FOR SALE

1977 FORD LNT 800, 43,000 GVW equipped with Husky model B60 knuckle boom loader and 14 ft. Thiele fat dump bed with 42" sides, 1977 Ford F704, 24,000 GVW equipped with Stanco Hap 2 knuckle boom loader with remote controls and 12 ft. Thiele fat dump bed with headboard. The Davey Tree Expert Company, 117 South Water Street, Kent, Ohio 44240. 216 673-9511.

FOR SALE — Complete nursery and landscape contracting business in southern eastern Oklahoma. Excellent potential for growth in this rapidly expanding community. currently grossing over $70,000. Equipment, furniture, fixtures and stock included. Box 197, Weeds, Trees & Turf, Box 6951, Cleveland, Ohio 44101.

MAKE BIG MONEY with biggest efficient tank truck sprayer, 1800 gallon, live time, double stainless oval tank with insulation, 60 G.P.M. high pressure F.M.C. pump, Wisconsin engine and more. Doubles as water or chemical tanker or other uses. Save now. Paul Bunday Mfg. 603 Union Road, R2, Lebanon, Ohio 45036. 513 424-2052.

FOR SALE — Complete tree service company 15 years servicing Northern Indiana lake area. Equipment modern and good condition. Ligonier Tree Service, Ligonier, Indiana 46767. Phone 219 894-4358.

1977 F700 FLATBED truck with 361 V8 engine, 2 speed axle, many extras, low mileage: 1050 gallon fiberglass tank, skid mounted. 312 366-6176 after 7:00 P.M.

USED EQUIPMENT

2 — 50’ AERIAL BASKETS, brush chipper, stump cutter, 2 sprayers, small crane, Parkway Tree Service, 12028 West Cherry St., Wauwatosa, Wisconsin 53226. 414 257-1555.

FOR SALE: W-W soil grinder/shredder no. 412 EV with elevator, 16 h.p. Briggs-Stratton gas engine. Used very little; $1,000. Contact Irvin Greenhouse, 605 8th Street, Columbus, Indiana 47201. Phone: 812 372-3685.

SPRAYBAY hydrosedder with new engine and new pump in perfect condition, $2,900.00, ready to go. For details call 902 422-8449.

WOODS C80 heavy duty rotary cutter, used two seasons, like new, $1,000.00. Call Mr. Mazur 313 755-7565.

WANTED TO BUY

JACOBSEN SEEDER, model no. 524-100. Leisure Lawn, P.O. Box 6022, Bridgewater, New Jersey 08807. 201 722-5544.

AAA TREE SERVICE, INC. is interested in buying all types of used tree equipment, 1292 South Eastlake, Longwood, Florida 32750. Phone 305 339-5242.

SEEDS

LAWN SEED. Wholesale. Full line of top quality grasses. Improved bluegrass varieties, fine fescues and fine bladed ryegrasses. We specialize in custom mixing. Oliger Seed Company, 2705 Wingate Avenue, Akron, Ohio 44314. Call collect. 216 753-2259.

MISCELLANEOUS

WE DIG TREES. Will move large trees (5" to 10") with 78" tree spade. Will travel. Call or write Floral City Tree Service, 891 N. Dixie Hwy., Monroe, Michigan 48161. 313 241-7510.

TREE SERVICE EQUIPMENT — 4 chippers, 4 aerial bucket trucks, 2 crew trucks. John Mayer, 300 Muir Mill Road, Willits, Calif. 95490. Phone 707 459-2013.

WANTED TO BUY

When answering ads where box number only is given, please address as follows: Box number, c/o Weeds Trees and Turf, Dorothy Lowe, Box 6951, Cleveland, Ohio 44101.

Mail ad copy to: Dorothy Lowe, Weeds, Trees & Turf, P.O. Box 6951, Cleveland, Ohio 44101.
Let's get down to grass facts!

More than 8,000 businesses have emerged—almost over night—to serve the wants and needs of the 45 million home owners in the residential turf and ornamental market. Last year these businesses served over 4 million accounts, produced $1.25 billion in receipts and a 25% growth. These facts make it clear that chemical lawn care and maintenance services are booming businesses today...and have just scratched the surface of the huge residential market. If you've been trying to sell this emerging service industry, we don't have to tell you how difficult it's been to reach. Now at last there is a magazine that delivers this exclusive audience. Now for the first time you can communicate with this growth market. Now you can match your message to the market.

Lawn Care Industry
A Harvest business publication.

lawn care...the growingest market.

Summer weed control starts with Dacthal.

DUCTHAL® herbicide solves midseason weed problems before they start popping up on your turf.

An application two weeks before germination of Poa annua, late crabgrass, goosegrass, annual chickweed and other summer weed pests does the job.

Broad-spectrum Dacthal controls a wide variety of annual grassy and broadleaf weeds in turf and ornamentals. Even certain species of troublesome Veronica wither up and die after a postemergence watering with Dacthal.

Dacthal won’t harm delicate turf. In fact, it is recommended on all turf grasses except bentgrasses mown to putting green height. No wonder it's America’s favorite turf herbicide.

And, if you plan to reseed in the fall, you’ll want to go with Dacthal. It won’t interfere with fall seedings because it has a half-life of 90 to 120 days. Furthermore, you can apply Dacthal to new seedings in early spring after the grasses have exhibited a uniform greening of newly sprouted grass (1 to 2 inches in height).

See your turf chemicals supplier, or contact the Diamond Shamrock Sales Office nearest you: Three Commerce Park Square, 23200 Chagrin Blvd., Beachwood OH 44122 • 1401 W. Paces Ferry Rd., NW, Atlanta GA 30327 • 5333 Westheimer Rd., Suite 850, Houston TX 77056 • Commerce Plaza Bldg., 2015 Spring Road, Oak Brook IL 60521 • 617 Veterans Blvd., Redwood City CA 94063.

Diamond Shamrock
The resourceful company
"Tough K.C. Chiefs need tough grass! That's why I picked baron Kentucky Bluegrass."

George Toma, Director of Field and Landscaping Operations, Kansas City Chiefs and Royals, and consultant for all Super Bowl games.

"I need a grass that will withstand the wear and tear of forty big football players on it five days a week from August to December. With the toughness of Baron there are darn few worn out spots."

George Toma explains to Peter Loft:

"I overseed this practice field with 50 lbs. of Baron as early as February and the field is ready in April. We'll have good grass all the way through the season."

"With the field in use so much of the time, I need a grass that doesn't need much care. In the 3 years this field has been in, I've never used a fungicide, insecticide or herbicide. That's a plus for me. I can only water maybe once a week and you can see how green this field is."

"We fertilize well around Thanksgiving. With the lower fertilization requirements of Baron, we don't have to worry about tender grass. Baron stays tough."

"We mow whenever the grass needs it. That may be once, twice or even three times a week. We only remove ¼ of the growth and usually cut it to ¼' up until June 1. After that we keep it at 2'."

"The players love this field. They even replace their own divots! And I think psychologically they practice better when they see a beautiful field like this."
