VEGETATION MANAGEMENT

By Roger Funk, Ph.D., Davey Tree Expert Co., Kent, Ohio

Q: What herbicide(s) can we use to remove crabgrass from bentgrass greens which will not injure the bentgrass? (Tennessee)
A: Pre-emergence herbicides such as Betasan can be used, but repeated use may reduce stress tolerance and increase disease incidence. Postemergence herbicides such as DSMA have also been used, but the potential for injury is high, particularly at high temperatures.

Perhaps the best solution is to remove the crabgrass by hand and improve the growing conditions to favor bentgrass growth.

Q: At what height should bermudagrass be mowed on a football field, and when should it be cored? (South Carolina)
A: Hybrid bermudagrass is mowed at one-half inch; common bermudagrass, at one inch. Core cultivation should be done after bermudagrass begins growth in the spring.

Q: When is the best time to control oxalis?
A: Any broadleaf weed can be controlled best when the weed is actively growing.

Q: Is it possible for a tree to be injured by lightning and not have any external symptoms such as strips of bark burned or peeled off?
A: Yes, internal tissues in the trunk and roots may be severely burned without external evidence. Symptoms of injury may not become apparent until several months after the tree is struck by lightning.

Q: What herbicides will control the weeds that were controlled with Silvex? Are there other herbicides available to replace 2,4-D if it is removed from the market? (New York)
A: Dichlorprop (2,4-DP) in combination with 2,4-D will control many of the same weeds controlled by Silvex. Spurge can be controlled with DCPA and bromoxynil.

As an alternative to 2,4-D, MCPA is reportedly a viable substitute as are a few experimental compounds. However, I do not feel we should allow the 2,4-D turf registration to be cancelled without giving it a fair trial; I have yet to see any scientific data that supports the claims being made against it. Support the Professional Lawn Care Association of America's campaign to save 2,4-D. Their address is 435 North Michigan Avenue, Suite 1717, Chicago, Illinois 60611.

Q: Where can I obtain a compound called Anhydrite? It is used as a soil amendment.
A: Check with supplier of gypsum. Anhydrite is anhydrous calcium sulfate.
