Kings Island and Oak Harbor, two small communities separated by about 250 miles of checkerboard Ohio farmland, don’t have a whole lot in common. But they do share pride and a long-term commitment to excellence in their high school athletic programs. The evidence is two first-rate natural turf playing fields.

Small potatoes? Hardly.

The National Federation of State High School Associations reports more than 14,000 schools involved with high school football, more than 13,000 with baseball, and another 4,500 offering soccer programs.

Prep athletics continue to grow, but shrinking budgets result in many young athletes using facilities that are often poorly planned, worn out or neglected, sometimes even dangerous.

The importance of proper athletic field construction and maintenance came down hard at College Football Hall of Fame at Kings Island just a short drive from Cincinnati.

Fall religion
The Hall of Fame, located on a knoll within eyesight of the large Kings Island theme park, displays relics of our fall religion beside the microchip wizardry of computers and film presentations. It is a neat slice of Americana; as American as the “rah rah” of a Saturday afternoon in the fall.

But when it came to the game itself, the Hall of Fame flopped when it built a field of its own in 1981. What should have been a showcase for the sport turned into a sloppy, muddy headache instead.

This summer that changed.

The College Football Hall of Fame’s Galbreath Field sports a new Prescription Athletic Turf (PAT) playing surface and is home field for a pair of nearby high schools, including nationally-recognized Cincinnati Moeller. It also hosts the Collegiate Division III championships, the Amos Alonzo Stagg Bowl.

A tough choice
The PAT natural turf field was chosen even though an artificial surface received serious consideration.

“We’re basically a high school stadium and we’ve seen enough to know that grass for growing young people is a safer surface,” Don Schumacher, general manager of the Hall of Fame, says. “Also, cost was a major consideration. We figured it would cost about $600,000 with synthetic turf and we might have to replace it in eight or nine years. The PAT cost $300,000.”

Strengthening the swing to grass was the availability of professional maintenance help from the nearby Jack Nicklaus Sports Center with its two golf courses. The Nicklaus Sports Center is owned and managed by the Taft Broadcasting Company which also manages the College Hall of Fame.

PAT, invented by Dr. William Daniel of Purdue University, provides a flat, moisture-controlled playing surface. The turf is placed over a bed of 12 to 14 inches of sand which, at Galbreath Field, covers a network of 2-inch perforated tile (15 in all) running lengthwise every 11 feet apart. These tiles connect to a main drain which leads to a pump house.

A thick plastic sheet lies just below the layers of turf, sand, and tiles. Electronic sensors measure the moisture content. Watering is accomplished in two ways: via traditional in-ground sprinklers (Galbreath has 21 Toro sprinkler heads on the field and about 50 around the perimeter) and by pumping water back through the system beneath the field.

“Don’t misunderstand,” Schumacher says. “I’m not anti-artificial turf, but when you combine the savings, the utility of use and some concern for younger players, and then we have professionals to maintain it—the PAT is right for us.”

The field is excellent for Moeller which shares the field with neighboring Kings High School. Moeller, perennial Ohio champion, is consistently ranked as one of the finest high school football teams in the nation and this season hosted Christopher Columbus, Miami, FL, and Cathedral Prep, Erie, PA, at Galbreath. Gerry Faust coached and won honors at Moeller before being tabbed as head coach at the University of Notre Dame in 1981.

But, Galbreath Field was anything but championship prior to this season.
Carved from a woodlot in 1981, its natural soil base had literally been chewed into a dustbowl by almost daily rounds of football and soccer. Built with a 21-inch crown, forward passes at the Hall of Fame field resembled mortar lobs and long passes in soccer games took parabolic routes to their destination.

"The first year we had 18 or 19 high school games," Schumacher explains. "We didn't have any rain and the field was dry every game. We tore the turf (the field had been seeded with fescue) pretty badly, but we thought maintaining a field was easy and that everybody could do it."

Management at the College Hall of Fame pulled out all the stops in 1982, scheduling a full program of youth football and soccer in addition to the high school games and season-ending state playoff game.

Disaster struck. "The field started to tear up," Schumacher says. "By the time we made it to Thanksgiving the top six inches of material were churned to a pudding. It wasn't even safe to walk on. What a mess."

The field was resodded with bluegrass in March 1983 in an attempt to bring it back to life. Youth football and soccer programs were dropped.

The bluegrass looked good ("We found the bluegrass tended to regenerate and it also made for better footing," Schumacher says) but the basic problem remained. Rains turned the surface mushy and conditions weren't good for the Stagg Bowl which featured Augustana and Union City Colleges.

When officials from the National Football Foundation and Hall of Fame, Inc., owners of the field, went looking for answers they didn't have far to go. Spinney Field, the PAT prac-

Tice field for the Cincinnati Bengals professional football team, was nearby. Eventually a meeting was arranged with PAT proponent Daniel at Purdue in Lafayette, IN.

"Now that we have a surface that can control the moisture, we can somewhat control the wear," Schumacher explains. "We're very eager to get to the fall of 1985."

This past year marked a renewed interest in the sand-concept PAT system with the University of Mississippi removing an old artificial surface in favor of PAT at Vaught-Hemingway Field in University, MS. PAT fields have been in use at three high schools, two in Indiana and one in Michigan, for the past decade with all three holding up well under intensive use. There have been problems, however, although they don't appear to have been a result of the PAT concept.

Alkalinity woes
In Evansville, IN, for instance, an inability to keep healthy turf on a PAT field was eventually traced to the high alkalinity of the city water supply. Bob Meyerholtz, who oversees the field, says efforts to grow first Bermudagrass, then fescue, then zoysia failed as the alkalinity of the soil, irrigated with city water, climbed to a pH of 8. Meyerholtz, a teacher of agriculture at Reitz Memorial High School, says phosphoric acid is now added to water used on the field and the turf is showing "a definite improvement in growth, color, and standibility."

Meyerholtz admits the terrific usage the field gets (it is used by the junior high and high school teams from two schools) keeps it from being a showcase. "We have so many things on it, including band practices once or twice a week. We do have a problem in keeping grass in the center of the field," he says.

The PAT natural turf field was chosen even though an artificial surface received serious consideration.

Tax money used
PAT remains beyond the financial reach of most high schools, however, even ones like Oak Harbor in Northwestern Ohio, the beneficiary of a tax windfall from a nearby nuclear power plant. Once one of the poorest districts in that part of the state, the Benton-Carroll-Salem District (of which Oak Harbor is a part) has literally uncorked a magic genie.

"The state says you can't save the money," School Superintendent Mel Hoover says of an ambitious project to upgrade the school's athletic facilities. "You have to use it and have a reason for using it, so we're using it."

The school sports a lush new football field encircled by a rust-colored, latex-based, all-weather track with accompanying permanent metal stands and concession stand. A baseball diamond with a grass infield, four new tennis courts, a football practice area and an encircling cross country course complete the athletic complex.

Price tag for all the above? About $650,000, according to Hoover.

Even with the taxes generated by the Davis-Besse nuclear power plant, however, school officials keep a careful eye on expenses.

Subsoil taken from the football field site, for instance, was used to create a hill on the school's cross country course. And, when it became apparent the seed that had been planted the previous fall on the football field wasn't going to provide an attractive playing surface, Hoover and a handful of volunteers (mostly teachers) resodded the field themselves.

"We got a pretty good crop of weeds from the straw that was on the seeds, but we didn't feel like the grass was going to mature," he recalls. "We waited to see what was going to happen, but we couldn't wait any longer because we had to give the sod enough time to anchor itself."

Hoover, who built and operated a nearby golf course prior to heading the neighborhood school, remains protective of the field which is built over native clay soils.

The field gets "tender care," he says, including liberal applications of the soil conditioner Turfas and regular aeration. Fertilizer for the turf (a mixture of Nugget, Cheri, and Adelphi Kentucky bluegrasses) is applied four times annually, while irrigation is provided by electronically-timed Toro Mistamatic sprinklers and drainage by four-inch field tile with off-field catch basins.

Hoover admits his school could have spent more on its athletic fields, but he doesn't feel the extra expense would have accomplished anything.

"I think we have excellent facilities and they stay in good shape," he points out. "The key, I think, is keeping them well maintained."
