The trick to selecting trees for golf courses is matching their biology with existing conditions on the course. That match has been well developed by horticulturists and ecologists.

A plant management approach would stress that certain trees tolerate and even thrive under difficult conditions while others either die or require intensive maintenance.

Four groups of trees are well-suited for use on golf courses. It is particularly important to recognize that all of these groups of trees will grow under the most favorable conditions but, as oxygen becomes more limiting, fewer trees will tolerate adverse conditions. Groups 1 and 2 will grow under all conditions; Group 3, fewer adverse conditions; and Group 4 will require the most favorable environmental conditions.

**Group One: Low Oxygen, Wet Soils**

Trees under average golf course conditions must often tolerate low oxygen soils and some flooding. In nature, they frequently grow in swamps and along lake shores or streams. These trees are best separated into two subgroups; those requiring full sun and those preferring shade.

Full sun trees will take flooding and tolerate low oxygen soils but must receive full sun. These are essentially classified ecologically as intolerant species. (See Tables)

Trees which grow in low oxygen soils, yet perform best in shady conditions, are less numerous. They are frequently swamp plants that grow in either shade or full sun. The key is these understory or specimen plants will grow in heavier soils where other trees might require extensive drainage.

A little planning and research on appropriate trees for your golf course can offer big time and money dividends in the long run.

**Trees for Golf Courses**

by Douglas Chapman, horticulturist-administrator, Dow Gardens, Midland, MI

*Celtis occidentalis*, common hackberry, is a tree that requires well drained, fertile soil and is good for intensely maintained areas.

continued on page 84
GROUP 1 — Low oxygen tolerant trees which require full sun
Alnus glutinosa (European Alder)
Fraxinus americana (White Ash) (after it has passed the juvenile stage)
Fraxinus pennsylvanica (Green Ash)
Larix laricina (American Larch)
Platanus acerifolia (London Planetree)
Quercus imbricaria (Shingle Oak)
Quercus palustris (Pin Oak)
Salix spp. (Willow)
Sorbus aplies albids (Common Sassafras)
Taxodium distichum (Common Bald-cypress).

GROUP 1A — Low oxygen-tolerant species preferring shade
Alnus sacharnum (Silver Maple)
Aesculus hippocastanum (Common Horsechestnut)
Carpinus caroliniana (Am. Hornbeam)
Crataegus spp. (Hawthorn)
Juniperus virginiana (Eastern Redbud)
Larix decidua (European Larch)
Ostrya virginiana (Am. Hophornbeam).

GROUP 2 — High water table trees
Acer negundo (boxelder)
Acer pseudoplatanus (Planetree Maple)
Acer rubrum (Red Maple)
Aesculus glabra (Ohio Buckeye)
Castanea dentata (American Chestnut)
Chionanthus virginicus (White Fringetree)
Fagus grandiflora (American Beech)
Fagus Sylvatica (European Beech)
Gleditsia triacanthos (Thornless Honeylocust)
Magnolia acuminata (Cucumbertree Magnolia)
Ostrya virginiana (American Hophornbeam)
Pinus albiculans (White Bark Pine)
Pinus flexilis (Limir Pine)
Pinus jeffreyi (Jeffrey Pine)
Pinus resinosa (Red Pine)
Platanus occidentalis (Am. Planetree)
Quercus cocinea (Scarlet Oak)
Quercus imbricaria (Shingle Oak)
Quercus palustris (Pin Oak)
Quercus robur (English Oak)
Tilia americana (American Linden)

GROUP 3 — Well-drained fertile soils
Acer saccharum (Sugar Maple)
Carya ovata (Shagbark Hickory)
Crataegus occidentalis (Common Hackberry)
Cercis canadensis (Eastern Redbud)
Cornus florida (Flowering Dogwood)
Liriodendron tulipifera (Tuliptree)
Malus spp. (crab apple)
Ostrya virginiana (Am. Hophornbeam)
Pinus strobus (Am. Hophornbeam)
Quercus rubra (Red Oak)
Quercus velutina (Bur Oak)
Tsuga canadensis (Canadian Hemlock).

GROUP 4 — Droughty site trees
Abies concolor (White Fir)
Betula papyifera (Paper Birch)
Catalpa spp. (catalpa)
Elaeagnus angustifolia (Russian Olive)
Ginkgo biloba (Ginkgo)
Gleditsia triacanthos (Thornless Common Honeylocust)
Gymnocladus dioicous (Kentucky Coffeetree)
Malus spp. (crab apple) (to a lesser extent)
Nyssa sylvatica (Black Tupelo)
Pinus ponderosa (Ponderosa Pine)
Quercus macrocarpa (Bur Oak)
Quercus velutina (Black Oak)
Robinia pseudacacia (Black Locust).

Several superintendents are trees that grow in water table site, tolerate flooding for various periods of time, and exist in low oxygen situations. Contrastingly, Red, Sycamore, and Norway Maples will grow in a wide range of soils, from fertile to heavy clays yet prefer frequent rains normally received throughout the Great Lakes and Northeast areas.

American and European Beech are similar yet have dramatically different pH requirements. American Beech prefers a slightly acid, well-drained soil, tolerating high water tables. European Beech grows best in a slightly alkaline soil but on a broad range of soil types. American Beech transplants with great difficulty and grows best in the Northeast on acid soils, whereas European Beech transplants quite readily and will tolerate a much broader soil range.

Further, all of the improved beech cultivars, such as weeping ('Pendula'), copper leaf ('Riversii'), and fern leaf ('Asplenfolia') forms, are of European Beech. There are no cultivars of American Beech.

European and American Larch grow in a wide range of soils and flourish in high water tables. European Larch is less sensitive to air pollutants yet will not tolerate chlorides. American Larch is extremely sensitive to many air pollutants.

White and Green Ash differ in one key soil requirement—pH. They both thrive on a wide range of soils, tolerate some flooding, and prefer a relatively high water table. But White Ash grows on acid soils (Northeast U.S.), where Green Ash prefers alkaline pH.

Many pines require extremely well-drained soils with high water tables. Scotch and White Pines grow on a wide range of soil conditions as long as the upper 24 inches are reasonably well drained. White Bark, Jack, Limber, Jeffrey, and Red Pines grow on sandy, infertile soil with a perched water table. In fact, they grow better in infertile than fertile soils, e.g. beachhead sand.

Ponderosa Pine is unique in that it grows on well-drained soils but is extremely drought tolerant. Its native range is the Western U.S., yet it adapts to other areas, e.g. Midwest, Central, and Northeast, as long as the soil is extremely well drained. One should take advantage of the unique characteristic—extreme drought tolerance.

Oaks are as varied as the maples. They grow in a wide range of soil conditions from fertile, well-drained soils (White Oak), to heavy, lower oxygen soils (English, Red, Scarlet, and Pin

Ponderosa pine is extremely drought tolerant and adapts well to much of the United States.
Estate Turf Spreader  Model 700
$365.00
Freight Included
• Spread seed, sand or fertilizer, lime, de-icers
• Big 800 lb. capacity
• Ground driven
• Rugged Steel chassis with Polyethylene hopper
• Unique double-action drag chain prevents clogging while calibration is provided by 0 to 2 1/2 sq. in. opening

Model 108
$217.00
Freight Included

Estate “Pressure” Sprayer
Perfect for spraying fruit trees, shrubs, yards, or pastures.
• Heavy duty 15-gal. poly tank,
• Adjustable booms sprays 10-ft. swath.
• Comes with hand held sprayer, and 10 ft. hose.
• Sprayer operates on 12-volt power, with easy access on/off switch.
• Lightweight, easy to store, (41 lbs.)

Estate “Versatility” Wagon  Model 300
$479.00
(5 ft. bed)
(Add $72.00 for dump option) Freight Included
• 1-ton hauling capacity with hand operated hydraulic dump system
• Heavy structural steel frame
• Removable Side Racks
• High Flotation Tires
• 5 ft., 6 ft. & 7 ft. beds available
• Also, single axle and tandem axle trailers available

Country Manufacturing, Inc.

Circle No. 109 on Reader Inquiry Card

Ostrya virginiana, American hop hornbeam, grows well in a high water table, but requires a well-drained upper 18 inches of the soil profile.

Bur Oak, crab apples, catalpa, Honey Locust, hickory, and Kentucky Coffeetree compete well with turf without damaging it.

Kentucky Coffeetree are several of the trees to grow in companion with turf as they compete well while not damaging the grass growth.

So, “What is a prime tree for a golf course?” A prime tree for a golf course is something that grows well along a water hazard (willow, European Beech, Red Maple), flourishes in competition with turf (Kentucky Coffeetree, crab apple, Bur Oak), or just adapts well to high maintenance, adequate moisture, and good drainage frequently found near tees and greens.

It is up to the golf course architect and superintendent to select trees that match the site and maintenance budget. But, remember there is no such thing as a bad tree. When matching biology with environment, each tree species can be best for those conditions.

Douglas Chapman is horticulturist, administrator, The Dow Gardens, Midland, MI, and serves on the WT&T editorial advisory board.
