Competitiveness of Ryegrasses with Annual Bluegrass

by R.W. Daniels

Reality is that until Poa annua can be eradicated, turfgrass growers must try to manage the existing invasion of this turf species.

Research performed at the Nova Scotia Agricultural College during 1983 was directed to:
A reduce the invasion of annual bluegrass in a turfgrass stand and,
B reduce the decline of this species in turfgrass where it presently exists.

All experiments have been conducted both in growth chambers and field plots.

Long term (three years) effects of competitive factors will be evaluated.

Test results

Annual bluegrass (Poa annua L) and five perennial ryegrass cultivars, Citation, Derby, Linn, Loretta and Manhattan, grown in monoculture and in competition with annual bluegrass were compared in a controlled environment pot culture.

Ryegrass cultivars grown in monoculture showed a wide variation in their competitive ability as evaluated by number of tillers, leaves and total leaf area.

These same factors made them competitive with annual bluegrass. The ryegrass cultivar Citation was the most competitive against annual bluegrass. All other tested cultivars were about equal in competitive ability. Little difference between cultivars was evident in terms of fresh weight and dry weights of tops and roots of the plants.

To reduce the decline of annual bluegrass and evaluate the performance of ryegrass cultivars as competitors in established turfgrass stands, various forms of nitrogen were used.

All cultivars of perennial ryegrass Citation, Linn and Manhattan and annual bluegrass were fertilized with NH₄ (ammonia form of nitrogen) and NO₃ (nitrate form of nitrogen). Ratios of NH₄:NO₃ used were 100:0; 75:25; 50:50; 25:75 and 0:100. The ratio of NH₄:NO₃ of 25:75 produced the most superior turfgrass plants in terms of competitiveness (number of tillers, leaves and total leaf area.)

In fact, all plants evaluated responded best to this fertilizer ratio. The second best ratio of NH₄:NO₃ was 50:50. The poorest plant growth was from plants fertilized with NH₄:NO₃ ratio of 100:0.

Advances in Turfgrass Pathology

published by HARCOURT BRACE JOVANOVICH PUBLICATIONS in cooperation with Dr. B. G. Joyner, Dr. P. O. Larsen and Chemlawn Corporation

This extensive volume contains chapters on:

• turfgrass diseases
• cool v.s. warm season pythium blight and other related pythium problems
• snow molds of turfgrasses
• fairy rings
• leaf spot of Kentucky Bluegrass in Minnesota
• initial and field fungicide screening
• turfgrass disease resistance
• PLUS MUCH MORE!

ADVANCES IN TURFGRASS PATHOLOGY is a compilation of more than 23 reports and discussions by the nation's leading turfgrass pathologists. Explore the diseases that attack turfgrass. Find out how to conquer the battle of turfgrass diseases.

KEEP CURRENT WITH NEW IDEAS ON HOW TO HANDLE TURFGRASS PROBLEMS WITH ADVANCES IN TURFGRASS PATHOLOGY.
