Apron Treated

Untreated

Apron, a systemic seed treatment fungicide, works on contact to control Pythium on the outer surface of turfgrass seed.

As the seed starts to germinate, Apron is systemically translocated throughout the entire growing seedling. Since Apron systemically protects young plants from Pythium infection, you get maximum emergence and seedling establishment. This allows you more maintenance time for your green and tee establishment program.

After seedlings are established, it is recommended that you follow up with fungicide treatments of Subdue to maintain Pythium control in turf.

Call your seed distributor and ask for Apron treated seed for all your professional turfgrass plantings.

Milorganite stands alone
Suppling Nutrients the Way Plants Want Them

MILORGANITE (NATURE'S WAY) VS SYNTHETICS

- No matter how hard scientists have tried, they have failed to match synthetic nitrogen's release with natural growth patterns.
- Granulation does make a difference. Slow and even release by nature's soil bacteria provides Milorganite's nitrogen when and as grass needs it — Never duplicated by chemical fertilizers.

★ THE MILORGANITE EXTRAS ★
SUPPLIES HUMUS: In addition to being the ideal fertilizer, Milorganite also adds large quantities of organic matter (humus) to the soil. Naturally organic Milorganite actually improves the plant growing capabilities of all soils and has been perceived to reduce disease incidence and the build up of harmful thatch.

NO WATERING IN REQUIRED: Naturally organic Milorganite does not require watering in, so lawns require less water in the heat of summer. Naturally organic Milorganite Improves water holding capabilities of most soils for improved drought resistance.
