BY THE LIGHT

Landscapers on the cutting edge of the industry are beginning to offer nightlighting installation as a viable add-on service. Golf course superintendents and park managers are also taking advantage of the trend toward 24-hour beauty.

by Jerry Roche, executive editor

Many landscapers are planning to cash in on the nightlighting market, which is expected to grow significantly.

Using "the light...of the silvery moon" to illuminate landscapes sometimes just isn't good enough.

For stunning, you can't beat a well-lit landscape at night. For secure, you might consider installing an intruder alarm system—but nightlighting can help. For safe, there's nothing like having a well-illuminated driveway and sidewalk.

These, then, are the main reasons to sell nightlighting systems to landscape clients—whether you're a golf course superintendent looking to spruce up a clubhouse area, a contractor looking to make a little extra cash on your next residential installation, or a park superintendent looking to minimize vandalism.

The trend toward night-lit landscapes has captured the fancy of homeowners and facility managers in the extreme South and Northeast. If lighting follows other landscape trends, it will soon be popular from sea to shining sea.

Lighting boom

"There's a tremendous excitement for nightlighting going on throughout the country," notes Larry Powers, president of Genlyte, Inc., Littlestown, Pa. "There's a big market for high-end residences, hotels, restaurants and all types of retail establishments, particularly stand-alone establishments. We see a real explosion in the coming years."

"I see a tremendous opportunity for a contractor. In many areas of the country, they would have a tremendous surge of business. We think it can be very profitable, too. One of our distributors in northern New Jersey says that they have never sold a landscape lighting job under $1,500."

Landscape lighting, a $120 million a year business at the wholesale level, is projected to grow 10 to 15 percent per year over the next five years.

"This is an extremely hot area now," agrees Rick Wiedemer of Hinckley Lighting, Cleveland, Ohio. "People are pouring thousands of dollars into their landscapes. But you can't see the expensive landscaping unless you light it."

The art as science

Good landscape lighting is as much art as science. Few hard-and-fast rules apply, but it employs certain funda-
mentals. Knowing the basics will help
the job go easier, minimize callbacks
and more fully satisfy the customer.

"The average landscape contractor
won't know about the aesthetics of
landscape lighting unless he or she
goes to some seminars or places where
somebody teaches good lighting
techniques," Powers says. "The
American Lighting Association puts
on a series of lighting seminars
throughout the United States on
techniques of landscape lighting."

Neil Mitchell of Major Electric
Supply, Pawtucket, R.I., organized a
seminar in September for landscape
architects and contractors and
electricians. Despite terrible weather,
a standing-room-only crowd showed
up.

"Selling landscape lighting is as
easy as taking candy from a baby,"
Mitchell believes. "All the contractor
has to do is open up his yap. If it's
installed at the time the landscape is
being installed, it's very easy and
economical."

Mitchell says that contractors can
charge homeowners $100 to $200 per
fixture and make a good profit.

"We've found that the average
residential lighting sale is $3,000 to
$5,000," notes Wiedemer. "On big
residential jobs, we think that it's
probably best to follow up a year later
with lighting. If the owner is tapped
out after the landscape construction,
the lighting might come into play even
two to three years down the road."

Lighting by design
When selling lighting, the design be-
gins by determining the client's
needs. Since there are so many fix-
tures on the market, the first step is to
gather information and formulate a
plan based on specific requirements.
Make sure to ask:

- What lighting effect does the cli-
  ent expect?
- Does the client entertain often?
- Where are the guests usually lo-
  cated?
- Where should the lighting sys-
  tem be controlled?
- Is security a primary concern?
- Which key landscape features
  should be used as focal points?
- What tone or feeling do you want
to achieve?

Next you should define the budget
and identify the lighting manufactur-
ers that fit your needs. Finally, select
and place specific lighting fixtures.

"There are a lot of different grades
"Most people aren't very happy with
the very low-end products once they
put them in. If I were a contractor in-
stalling a job, I'd want to make sure I
had a quality product with some war-
ranties. Dogs wet on them, sprinkler
systems sprinkle on them and they
take every kind of outdoor abuse that
there is."

The right light
Fixture selection is a critical decision.
Selection is made by considering eco-
nomics, positioning, shielding and
In No Time At All

Before the sun goes down, you too can become an expert. Grasshopper’s instinctively natural controls, high productivity and durability make total mowing efficiency easy to learn.

No wheels to turn. No gears to shift. No pedals to push. Grasshopper puts total command of mowing in the palm of your hand. Instinctively natural control of steering, speed, braking, turns and forward/reverse motion is placed at your fingertips. For added comfort and safety, the levers return to neutral automatically.

Operation is virtually fatigue-free because you sit comfortably in a high-back suspension seat that supports your body in a natural position. No humps, controls or levers to straddle, either!

Zero-turning-radius and outfront deck design further simplify mowing by providing superior visibility, trim capability and maneuverability. The Grasshopper dealer network offers strong support and a versatile lineup that includes six models, 11 to 21 hp, deck options from 35" to 72" and year-round attachments.

For 20 years Grasshopper has advanced outfront zero-turn-radius mower technology so you can become more efficient "in no time at all."

The Ultimate Time-Cutter

A CRIME-STOPPER

Adequate nightlighting can deter crime, according to the National Lighting Bureau (NLB). A dramatic example was provided in a case history submitted to the organization’s National Lighting Awards Program.

After two female employees of the Bellevue (Wash.) Journal-American were accosted in the daily newspaper’s parking lot in 1982 and again in 1983, new lighting was installed. No further incidents have occurred.

Somewhat ironically, the new lighting—which provides 21 percent more light—costs 24 percent less per year to operate and maintain.

Annual energy consumption of the new system was $840. The cost of replacement lamps, lamp replacement labor and ballast replacement amounted to $505 per year, bringing the system’s total operation and maintenance costs to $1,345 per year. Because the new system’s 2.042 kilowatt-hour connected load is 54 percent less than the original system’s, utility costs were cut $454 per year.

In addition to the safety factor, Phillips says that several employees commented that the new lighting, with its distinctive “golden-white” color, made the buildings and landscape more attractive, linking them into a unified whole at night.

According to NLB executive director Richard H. Geissler, the Journal-American case "demonstrates the important difference between lighting management and lighting energy conservation."

More information about the benefits of lighting and specific techniques that can be applied to obtain them is available from the NLB. A free directory of the bureau’s publications is available by writing the NLB, 2101 L St. NW, Suite 300, Washington, D.C. 20037; or calling (202) 457-8437.

LOW-VOLTAGE, NOT LOW-PROFILE

More and more, experts are agreeing that low-voltage landscape lighting is the thing to sell to residential customers, rather than what they call "line-voltage" lighting systems.

Low-voltage systems are light, movable and safe. They employ a transformer to reduce voltage from line-level (110- to 120-volt house power) to low-voltage (12-volt, equivalent to an automobile battery) and direct-bury cable. Line-level equipment, on the other hand, requires junction boxes and underground conduit. It is extremely permanent, compared to its low-voltage cousin.

"Low-voltage systems are also very safe," notes Art Crisfield of Hinckley Lighting in Cleveland, Ohio. "If you run over the power lines with a mower or snip them with pruners, you won't blow your teeth out."

"They also have freedom of movement," notes Ken Nicholas, Crisfield's co-worker at Hinckley Lighting. "We make 6-, 12-, 18- and 24-inch stems on spikes. You just stick them into the ground where you want them. If you want to move them, it's extremely easy. You just pull them out."

Neil Mitchell of Major Electric Supply in Pawtucket, R.I. notes four advantages of low-voltage lighting:

- Generally speaking, the fixtures themselves cost less. Though cheap plastic models can be bought at discount department stores, lighting manufacturers and electric supply houses have top-of-the-line metal products priced beginning at $25 each, which is still relatively inexpensive compared to line-level equipment.
- Installation is considerably less costly. In many cases, digging is not really necessary. For instance, wiring for lights in ornamental beds can be easily buried under mulch. Licensed electricians are required to install the line-voltage systems; no license is needed for low-voltage installation.
- Systems are safer for children and pets. No "blown teeth," as Crisfield says.
- Though the bulbs are low-voltage and low-wattage, they produce two to three times the amount of lumens as their line-voltage equivalents.

"dayform" (what the fixture looks like in daylight).

Power sources include line-level (120-volt) and low-voltage (12-volt). Each has its advantages. Types of lamp sources are incandescent (including quartz/tungsten and halogen), metal halide, mercury vapor and high-pressure sodium. Colored lenses, no matter what type of source, should be used sparingly.

Placement, of course, is the key to a beautiful nightscape. Positioning fixtures in relation to the object to be lighted can radically affect the finished job's mood and tone. The best way to determine the most desirable fixture placement, most experts agree, is trial and error at the job site.

Locating a spot very close to the object creates tremendous contrast, character and shadows. The further the light source from the object, the softer the gradations between highlights of light and deep shadows.

As a sales tool
A final note to bear in mind. Observes Wiedemer: "When people go down the road at night and see these well-lit landscapes, they're going to ask who did the landscaping, not who did the lighting.

"The progressive, aggressive landscapers will recognize that this is an excellent add-on sale."

An instructional video tape produced by Genlyte can help landscape contractors acquaint themselves with the lighting design and installation market. It is available by writing P.O. Box 128, Littlestown, PA 17340 or calling (717) 359-7131.

To find out more about outdoor lighting, write or call the American Lighting Association, 435 N. Michigan Avenue, Chicago, IL 60611; (312) 644-0928. The ALA offers a 16-page, four-color brochure for $2. Landscape managers can also order bulk copies at 35 cents each with a minimum order of 250.
