ENVIRONMENTALLY SENSITIVE GOLF COURSES

Summer fertilization  Preparing for football season  Behind the Chemlawn sale
The latest 'word' in bentgrass is PennLinks.

Paul Latshaw is spreading the word.

Paul Latshaw holds the distinction of being the only superintendent of golf clubs hosting 3 major tournaments. With Paul's reputation, expertise and candor, he's a powerful promoter for PennLinks.

"I know PennLinks to be the finest creeping bentgrass available. I know it's been time-tested on the North Course greens here at Wilmington Country Club since fall of 1984.

"I know PennLinks has an extensive root system, heat tolerance, and requires very little grooming or verticutting because of its upright growth.

"The upright growth habit convinced me to overseed the fairways at Wilmington. I know time will prove I made the right choice. And I like that, too.

"PennLinks. Spread the word."

Why didn't this book get more media attention?

Many of our readers are skeptical when it comes to stories about how industry is destroying the environment. Some of the skepticism comes from the fact that they make their livings by caring for the earth. But they also feel a righteous indignation, because they know that the facts are being twisted or not reported.

There is, however, a book that explains exactly what is and is not happening to the environment, and it would make a great gift for special clients: *Trashing the Planet* by Dixy Lee Ray and Lou Guzzo (1990, Regnery Gateway Publishers, Washington, D.C.) Ray once headed the Atomic Energy Commission, was governor of Washington, and has been associated with the U.S. Bureau of Oceans. She's also taught zoology at the University of Washington. Guzzo is a tv/radio/newspaperman and author.

*Trashing the Planet* is loaded with factual information refuting every eco-crisis you've come to love over the years:

**The greenhouse effect**—If the severe winters of 1978, 1982 or 1989 didn't convince you that the earth is not overheating, consider that, according to Ray, the computer models used to predict global warming are too simplistic and contain much guesswork. There also are variables that affect temperature that we can't control: ocean temperature; currents; volcanic eruptions; solar activity.

And while reduction of CO₂ is advisable, the great fluctuations of earth's temperature cast doubt on the belief that man's increased carbon dioxide output is causing global warming.

**The ozone layer**—As Ray explains, the thickness of the ozone layer changes periodically. Natural layer fluctuations are about 15 percent, and brief.

"The term 'ozone hole,'" writes Ray, "is misleading, since it persists for only a few weeks. The Antarctic ozone 'hole' grew during the early 1980s, becoming large in 1985, smaller in 1986, and reaching its greatest size in 1987. In 1988, the 'hole' did not appear as expected. It was finally discovered—only 15 percent as large as predicted and displaced over the ocean."

Ray also reports that penetration of ultraviolet light reaching the earth's surface has been decreasing up to 1.1 percent each year.

**Pesticides**—The amount of natural pesticides we eat every day is at least 10,000 times the level of pesticide residue from agricultural use of synthetics.

**Acid rain**—There are many sources: decaying organic matter in swamps and wetlands; volcanoes; lightning. Man-made sources have been reduced by more than 40 percent since the Clean Air Act of 1970. Other man-made pollutants include volatile organic compounds, ammonia and hydrocarbons. But insects and disease have combined to kill more trees than any man-made source.

Man's stewardship is far from perfect, as Ray admits. But the point of much of *Trashing the Planet* is that change—and taxpayer-funded clean-up programs—must be based on fact, not assumptions, and science must be allowed to play its part in further developments and solutions.

If you've not read *Trashing the Planet*, pick up a copy. The science is easy to follow, and it contains common sense we can all understand.
What you’re looking at is a way to go an entire season on a single herbicide application—a control zone in the top inch of soil that keeps weeds from germinating all season long. It can greatly reduce your use of post-emergence herbicides and hand-weeding in your ornamentals.

One application gives you up to eight full months of control. If you like what Surflan does, but prefer a granular form, you can use XL* herbicide. It contains the same active ingredient as Surflan. Apply it in the spring, and you’ll get a full season of broad-spectrum grassy weed control.

We have three different pre-emergence herbicides that make this possible. All of them are very gentle on your plants. And they bind tightly to soil particles, which makes them very resistant to leaching.

If you’re looking for grassy weed control, you can use Surflan* preemergence herbicide. Surflan is, in fact, so gentle that you can spray it directly over the top of delicate ornamentals. Yet it controls both grassy and broadleaf weeds. A single application lasts up to eight months. And it’s available as a sprayable or in a granular form.

We can show you lots of ways to control weeds more safely and effectively. They’re explained in our 40-page book, The Nursery And Landscape Guide To Responsible Pest Management. It also contains information on better ways to control weeds more safely and effectively. They’re explained in
trol insects and diseases. For a free copy mail the coupon, or call our toll-free number. Because you don’t need a lot of herbicide to get beautiful results.

You might think using less insecticide means you'll have to put up with more insects. But that's not necessarily the case. Because how you use your insecticide is as important as how much you use. With the right tactics, you can use a lot less and still get excellent results.

Here's a good example. By mixing insecticide with insecticidal soap, you can reduce the amount of insecticide you need on your ornamentals by about fifty percent. Insecticidal soap controls most soft-bodied insects and mites. By adding insecticide, you'll also take care of tougher insects, like scales and worms. University studies

A few ways to balance with your love for the environment...
Studies show that Dursban delivers better chinch bug control at lower rates than other insecticides. Suggest you may get better control than you get with insecticide alone.

Knowing exactly when to apply insecticide helps, too. For example, adult black turfgrass aetinius are first present at the same time the black locust tree blooms. Make your insecticide application then, and you’ll get the most efficient, effective control.

Your insecticide itself can also make a difference. After all, different insecticides work at different rates. Which is why Dursban* insecticide could be your best choice.

Just one pound active ingredient per acre controls chinch bugs, billbugs, sod webworms and a host of other insects. No other insecticide gives you so much control at such a low rate. It’s available in water-soluble packets. And it can be bio-monitored, which can reduce the likelihood of over-exposure.

Now, we realize you probably have some questions. That’s why we created The Turf Manager’s Guide To Responsible Pest Management. It’s 44 pages packed with information on the latest techniques for controlling insects, weeds and turf diseases. For a free copy, just return the coupon, or call our toll-free telephone number.

Because when you apply a little knowledge, you don’t need to apply as much insecticide.

The chemistry is right.
High pH challenges spray program

Problem: In our tree care spray program we are having pesticide mixing problems because of high pH. How do we solve this problem? (NY)

Solution: Certain pesticides can break down rapidly through a process called chemical hydrolysis when exposed to high pH of mixing water. Chemical hydrolysis takes place faster as the pH and temperature of mixture increases. Some insecticides can be hydrolysed, even within an hour after mixing if the water pH is high. Check with the manufacturers.

It is important to determine the pH of the mixing water. To lower the pH of water, buffering products such as phosphoric acid, hydrochloric acid, mono-ammonium phosphate (MAP) or diammonium phosphate (DAP) can be used. The first two products are seldom used because of handling and safety reasons. MAP and DAP are preferred because of ease of storage, mixing, handling and safety. These products can also serve as the source of nitrogen and phosphorus.

Reports indicate that one-to-two cups of MAP per 100 gallons of mixture is sufficient to help solve most hydrolysis problems. However, for individual product and different pH ranges it may be necessary to do some mixing and testing on a small scale.

It is also important to follow proper mixing guidelines. Always put ⅔ to ¾ of desired volume of water into the tank first, then add the buffering agent with proper agitation. Then add the wettable powders, flowables and emulsifiable concentrates, in that order. Fill with water to the desired volume. Read and follow label specifications for best results.

Managing Phytophthora root disease

Problem: We lost a number of azaleas and rhododendrons in some of our clients' properties. We think the problem is related to Phytophthora sp. root rot disease. For the remaining plants we plan to use Subdue fungicide treatment. Is there some way we can eliminate or minimize the Phytophthora fungus in the soil prior to replanting? (MI)

Solution: Phytophthora sp., the causal agent of root rot disease on azaleas and rhododendrons, can be a destructive pathogen in poorly drained, heavy clay soil. In this situation, plants should be planted slightly higher to overcome the drainage problem. You may have to use a Phthophthora-specific fungicide, such as Subdue or Aliette to manage the problem. Areas which are dead due to Phytophthora activity can be fumigated prior to planting new plants. Make sure there are no roots of healthy desirable plants within 3 to 4 feet from the diseased plants. If the landscape area is large enough, then you can use soil fumigants like Vapam. Vapam is a water-soluble liquid which will be converted to gaseous fumigant when applied to soil. The material can be moved downward with post-watering.

To be sure the planting site is safe to replant, run a bioassay. Plant indicator plants like tomatoes in the treated area and cover with a five-gallon bucket. Keep the plants covered overnight; remove the bucket and examine them. If they are healthy, the soil is safe to plant. If the plants are wilted, it indicates that the soil still contains Vapam, and planting should be delayed. Repeat until the soil is found to be safe to plant.

Read and follow label specifications for better results.

Reader resents chemical advice

Problem: Even as a forester, I am disheartened to read your response to the problem of Sapsucker damage to birch trees in the April 1991 issue. You obviously work for the interest of chemical corporations rather than that of 'Mother Nature' by encouraging the use of chemical pesticides to kill insects that are a necessary food source for this bird. If everyone followed your advice, then we may have a beautiful supply of birch trees, but no sapsuckers. I must just be different from most of your readers, in that I enjoy nature as it was meant to be, not what some would like it to be. It sounds like the real 'suckers' are your subscribers. (A reader)

Solution: Thank you for your comments. I understand your concerns; however, I disagree with your conclusion about my answers concerning the question, "What can we do to prevent injury from sapsuckers on birch trees?" The following is an excerpt from my suggestions:

"...if the problem is really objectionable, your best approach is to distract birds from feeding on trunks. Consider treating your trees for any insects such as borers. Mechanical devises such as aluminum foil wrapping or tying a pie pan to the trunk may also help distract birds from attraction to susceptible trees.

"Ropel, a chemical repellant, has label registration for bird problems. Try this on a very small area before trying on a large area. Read and follow label specifications for best results."

I provided several options to deal with the problem. As you indicated, your interest is different from others, particularly the person who has asked the question.

As a plant health care practitioner, my objective is to help keep the ecology, and preservation of environmental beauty.

An ‘environmentally sensitive’ approach to golf courses

...And landscapers, too, are looking at some of these courses to see what aspects they might sell to clients.

- The 1990s have been labeled the "Decade of the Environment." This prompts many landscape managers—and golf course superintendents in particular—to evaluate (or re-evaluate) their impact on the environment.

  There is a movement afoot (spurred by the golfing industry, its clientele and "environmentalists") for new golf courses to be environmentally sensitive, and for existing golf courses to embrace some of the same concepts.

  John's Island West Golf Course in Vero Beach, Fla. was designed by Tom Fazio to be such a course. Dr. John Fitzpatrick, executive director of the Archbold Biological Station near Lake Placid, Fla., is an ardent fan of John's Island West.

  "The property is one of the rarest habitats in North America," he told The Florida Green magazine. "Every square meter is precious to wildlife. There is a fairly large number of endangered species, and it is now a permanent habitat preserve that also provides recreation and beauty."

  Wolf Run, in Zionsville, Ind., is also a haven for various forms of wildlife, particularly birds. Wolf Run features bluebird houses and duck-feeding programs. Its owner, Dr. Jack Leer, will not allow maintenance crews to remove selected dead trees because they provide nesting areas for certain indigenous species of owls.

  Another of Wolf Run's environmentally sensitive plans is to incorporate as much tall unmowed grass as possible. These grasses serve as nesting places for wildlife.

  "We've got a lot of unmowed fine-leaf fescue blend that provides 30 to 40 acres of prairie-type long grasses," says superintendent Joe Kosoglov. "The place is just loaded with birds, squirrels and snakes—even though I'm not thrilled with the snakes."

  The course was grassed in the fall of 1988. "We actually do have sections of the property that were untouched during development," Kosoglov notes.

  And Wolf Run's unique "look" is gaining some attention from local landscapers who want to pick up tips on how to integrate such programs into residential and commercial settings. "We actually do have sections of the property that were untouched during development," Kosoglov notes.

A place for the birds

Nancy Sadlon: Don't immediately take down dead trees.

where one type of habitat meets another. The greater amount of edge you have, the greater the diversity in species.

3) Maximize the vegetation levels that exist. From groundcovers, to vines, to understory trees, to forest. Don’t take out understory areas unless it’s absolutely necessary.

4) Compromise some of the turf areas for other groundcover, native grass or wildflowers. “This is very important to ground-nesting birds and also provides a food source,” Sadlon says.

5) Resist temptation to widen the fairways.

commercial landscapes.

“I’ve had a pretty steady stream of landscapers check out the long unmowed fescues,” Kosoglov admits. “I’ve got a feeling they’ll be using them on slopes and unmowed areas. I’ve worked with some of the landscapers, and we’ve developed pretty good relationships.”

The Audubon program—“The New York State Audubon Society has a program to register properties,” says Kosoglov. “One of the types of properties they want to get registered is golf courses.

“They provide information on how to improve the properties for birds. We’ve enacted a few (of the society’s programs), but not as many as we’d like.”

The Audubon Cooperative Sanctuary System works like this, according to the society’s staff ecologist Jean Mackay: for a $100 fee, a participating golf course is asked to fill out a “wildlife inventory.” The Audubon Society then sends the course a written report with suggestions about how it can take specific steps to attract and preserve wildlife.

Some courses are already doing wonderful things,” says Mackay. “But they still sign up and we can then tell them how to enhance their existing programs.”

6) Provide slope changes and dust paths for ground-feeding birds.

7) Recognize, preserve or create food patches. These natural meadow areas are very high with plant materials that are important food sources.

8) Provide bird-attracting flowers into your garden areas to attract hummingbirds and butterflies.

9) Construct and/or restore native dunes or native grass areas.

10) Provide brush piles. Don’t mulch them and make them disappear right away. “They’re real important in cooler areas,” Sadlon adds.

11) Provide windbreaks. Much larger windbreaks are needed in the West.

12) Plant bird-attracting fruit-bearing trees and shrubs to provide important berries.

13) Provide water areas, and leave some edge vegetation; for food, cover and pollution filtration. Preserve wetlands and streams.

14) Preserve natural cavity nesting areas—tree snags—or provide artificial nest boxes. “Don’t run out and immediately take down the dead tree,” she concludes.

767-9051.

Long grasses—David Stone at The Honors Course in Ooltewah, Tenn., uses broomsedge, weeping lovegrass, lespedeza and tall fescue between greens, tees and landing areas. Native shrubs and tall grasses border the roughs, streams and pond shorelines for bird nesting.

“Our course looks different from one season to the next, and that adds interest,” Stone admits.

An avid naturalist, The Honors Course’s superintendent developed several programs to help identify, monitor and encourage a variety of wildlife species using the course’s environment. Not surprisingly, The Honors Course was recognized in 1991 by the USGA for its conservation and preservation activities, the first course so honored.

Ugly weeds in the tall grass are mechanically removed by chopping. Stone also uses a Bushhog on different parts of the course at different times of the year.

“Brush piles are great places for rabbits to hide,” Stone says. “But there is a fire hazard.”

An occasional birdhouse provides birds with a man-made shelter.
Introducing Toyota quality in a bigger package.
The new SDK10 skid steer loader.

One look tells you this machine can take on
your tougher jobs. It's packed with performance,
built with rugged durability and the world class
quality you expect from Toyota. Quality that's on
the surface and beneath it.

Start with 1800 pounds of operating load and
4740 pounds of breakout force. Massive frame
and load arms, dual self-leveling cylinders and
standard high output auxiliary hydraulics to run
a variety of attachments add up to the productiv-
ity you demand.

The Toyota 1Z, 4-cylinder diesel engine has the
power to deliver excellent traction for increased
digging and pushing. Plus servo-assisted steering
allows the operator to maneuver with less effort.

Operator convenience features include
excellent, all-around visibility, easy access to
hydraulic engine areas and easy attachment
changeover. Advanced instrumentation with a
vital warning system alerts the operator to critical
maintenance needs.

And an exclusive, Toyota maintenance-free
torque damper reduces loads on the drive
train for smoother operation and longer life.

The new SDK10 skid steer loader. Quality that
carries the load now comes in a bigger package.

Whether you plan to rent, lease or buy, see your
Toyota dealer today for an on-site demonstration.

Golf course from page 12

Birds also play an important role in the course's "environmentally sensitive" approach. Stone and his crew raised 11 birds in three years: eight still survive.

The wetland question—Another environmental question mark that could face superintendents in the future is preserving freshwater wetlands. According to a report by the GCSAA, "protection of wetlands and other valuable aquatic habitat has become an important part of golf course management."

Stone: seasonal changes at the Honors Course add interest, protect native habitat.

The GCSAA's position statement says: "Wetlands act as both a sponge and a filter to provide a built-in water quality maintenance system. Golf courses also benefit wetlands...by providing large recharge areas that help supply wetlands with much-needed water...and provide secondary filtration to help purify water entering wetland areas."

Says GCSAA government relations manager Don Bretthauer: "In some cases, golf courses are creating wetlands. It's a give-and-take type thing: take away wetlands, give some back. It's then the superintendent's responsibility to preserve the wetland."

Embracing the virtues—Golf course superintendents and landscape/lawn care companies alike argue that they, like their detractors, are also "environmentalists."

Golf course architect Pete Dye may have pointed the way for his colleagues when he used 15 miles of underground pipe in the design of the Ocean Course at Kiawah Island, S.C. The drain system picks up 300,000 gallons of freshwater every day, Dye says—"50 percent of the water that we need to irrigate the golf course."

As the courses and landscapes of the '90s are designed, more and more are embracing the virtues of being "environmentally sensitive."

—Jerry Roche
Chippers and shredders: keys to environmental maintenance

The rush by local and state governments to eliminate landscape debris from our landfills makes chippers/shredders an increasingly valuable landscape tool.

Chippers and shredders—from compact homeowner to commercially rugged pull-behind models—allow landscapers and golf course superintendents to re-cycle landscape debris, often on-site. They also offer another add-on service sales opportunity.

Chippers and shredders can provide various grades of re-usable mulch. They're perfect for disposing of tree prunings, broken branches and other landscape debris. While chippers are required for woody branches, shredders are best for brush, leaves, twigs and stalks.

"Chippers/shredders are like garbage disposals for the yard," says Ray Klubnik of The Tractor Place, North Royalton, Ohio. "In choosing what type of equipment you want, it's all application. You have to ask yourself these questions:

- How are you going to use it?
- How big are the yards?
- Are you pruning?

Three considerations you should take into account before purchasing are capacity, chipping knives and engine size.

Fixed hammers are used in some machines, flail knives in others. Limb capacity can range from 3 bushels for smaller consumer-type models to 28 bushels for larger machines. Engines for smaller units generally begin at 3 hp and progress to 8 hp—then there are industrial size machines with more than 100 hp.

When you're not the first to hit the four-wheel-drive front mower market, your initial effort better be better than good.

With the new John Deere F1145, both effort and execution grade out an "A".

Because when we put together this on-demand 4-wheel-drive diesel, we fortified it. Using the best of what we've learned from years in the tractor business.

And focusing on one thing no commercial operator can ever get too much of... durability.

What makes the new F1145 Front Mower so durable?

First, an exclusive hydraulic PTO clutch. With modulated (soft) engagement, there's no "kick in" jolt. And less wear and tear on parts.

The drive system, too, is
wheel drive

tougher than you'll find on any of the competition.

The F1145's transmission, differential, 2-speed axle and planetary final drives are lifted straight from our best-selling 855 Compact Utility Tractor. And the wet-disk brakes eliminate much of the wear other systems suffer with hillside mowing.

The new John Deere 24-hp F1145 will turn other front runners into also rans. See your dealer for more information. Or call 1-800-544-2122.

New Duosan® WSB is safer and easier to use—you handle only the bag, not the fungicide. And, the pre-measured soluble bags insure accurate applications every time.

Because each soluble bag contains both a contact and systemic fungicide, Duosan WSB is tough on diseases. It’s labeled to control a broad spectrum of diseases on turf, trees, shrubs and flowers.

Duosan WSB eliminates the need to purchase and store separate fungicides.

Order new Duosan WSB today.

Available in 12 oz. soluble bags (4 x 3 lb. case). Contact your Grace-Sierra distributor or call us toll free at 1-800-492-8255.

Make it easy on yourself. And tough on diseases. With Duosan WSB fungicide in water soluble bags.
**Chippers from page 15**

Small shredder/shredders will chip branches up to 1-1/2 inches in diameter. A 4 to 8 hp machine will chip up to 3-inch diameter materials. Larger machines handle up to 6-inch logs.

According to Klubnik, you can pay as little as $548 for the smaller chipper/shredders—or into the thousands of dollars for the heavy duty models. But however much you pay, "you should be able to pay for the machine in the first couple months of use," Klubnik observes.

No matter what size and style you choose to purchase, make sure your employees are trained in safe use. Most manufacturers offer safety training videos and literature.

Thousands Of Clean Used GMC Trucks Are Now Selling At An Astounding Rate.

GMAC financing at 7.9% APR* isn't the only astounding rate, either. We have many, many used trucks available, but they do move fast. Vans, dumps, flatbeds, high cubes and stake trucks are ready to roll at dealers across the country.

Most of these GMC Trucks are medium-duties equipped with 6.0L V8 engines, full bench seats and other power and comfort features. They come from well-known fleets, and they've been well-maintained.

We'll do the legwork to find the truck that's right for you. And your local dealer can work with you to make body conversions if necessary.

With 7.9% APR GMAC financing for qualified borrowers, you probably couldn't drive a better deal. So call today, and let us put you in a first-rate used GMC Truck. 1-800-825-8390

* 7.9% APR available only on 1991 and prior model year GMC Truck medium-duty used trucks to qualified buyers. Dealer financial participation may affect consumer cost. Length of finance contract is limited to 48 months. You must take retail delivery out of dealer stock by December 31, 1992. See your participating dealer for qualification details.
Taking good photos:
1. When loading film, take two and only two shots with the back open; verify that the film is winding before closing the camera back.
2. Always get closer to your subject than you think you should; it should fill the viewfinder.
3. Squint your eyes before you take a photo; if you can’t discern what you’re about to photograph, it won’t show up on the film.
4. Over-expose green turf shots by 1/2 f-stop.
5. Over-expose photos of a bare area or new planting (where there’s a lot of light soil in the photo) by 1 to 1-1/2 f-stops.
6. A polarization filter helps bring out the green color in a turf photo.
7. To photograph a large area and have it all in focus, set the f-stop as high as possible.
8. When photographing individual plants on bare soil, put the nose of the camera within three inches of the plant, take an extra exposure reading and lock the reading into the camera, then back up and shoot. A gray card (cheap and available at photo stores) can also be used for setting exposure.
9. Check that the rewind handle tightens up as you turn it, indicating the film is properly hitched.
10. If the camera seizes up after shooting the last photo on a roll, retake it on a fresh roll.
11. Photos can be taken with the camera held either horizontally or turned vertically. Bear in mind that vertical shots do not fit on the screen in most slide presentations.
12. Keep a cheap second camera around for “must have” shots; take photos with two cameras during important events.

Doug’s rules of thumb

What to photograph:
1. All new projects, before, during and after completion.
2. New plantings as they’re being made.
3. New plantings as the grass is coming up.
4. Nice overall turf shots (remember to take “pretty” shots, not just pictures of diseases and repairs).
5. Variety and product trials at field days.
6. Disease and insect problems.

Taking good photos:
1. When loading film, take two and only two shots with the back open; verify that the film is winding before closing the camera back.
2. Always get closer to your subject than you think you should; it should fill the viewfinder.
3. Squint your eyes before you take a photo; if you can’t discern what you’re about to photograph, it won’t show up on the film.
4. Over-expose green turf shots by 1/2 f-stop.
5. Over-expose photos of a bare area or new planting (where there’s a lot of light soil in the photo) by 1 to 1-1/2 f-stops.
6. A polarization filter helps bring out the green color in a turf photo.
7. To photograph a large area and have it all in focus, set the f-stop as high as possible.

12. Keep a cheap second camera around for “must have” shots; take photos with two cameras during important events.

—D.B.
...And it's low-dust, too.

Now the powerful turf insecticide that lets you lower the boom on damaging grubs comes in an even more convenient, low-dust formulation. Introducing new CHIPCO® MOCAP® brand 10G pesticide.

CHIPCO® MOCAP® brand 10G works fast to knock out subsurface insects before they can inflict damage. Then, its broad-spectrum activity goes after surface feeders like chinch bugs and the larval stages of sod webworms and billbugs. And, applied at the nematicide rate, CHIPCO® MOCAP® is one of the most effective nematicides you can buy.

Best of all, you now get all this time-proven turf pest control in an easier-handling, low-dust formulation. CHIPCO® MOCAP® brand 10G pesticide. Available from your turfcare chemicals supplier today.

New Low-Dust Formulation

Shooting from page 22

Keep a log of when, where and how each of your pictures was taken. This will give you a guide as to where your mistakes are occurring.

Most photo store owners can give you pointers on how to improve your photos—it seems they live to give advice.

Unfortunately, an automatic camera doesn’t do everything automatically.

The plague of under-exposed (too dark) photos haunts many beginners. Naturally, when it says the camera has automatic exposure, we assume it knows what it’s doing. Wrong assumption.

The electronic eye in automatic cameras takes a reading on the overall brightness of a scene to determine the best exposure. If you have a lake or a sand bunker in the picture, your photo will invariably turn out too dark.

Why? The extra light from the bright sand tricks the camera into thinking it’s photographing a much brighter scene than it really is.

This problem can be overcome by thinking about the shot you’re taking. If the picture contains something particularly bright, set the camera’s manual override to purposely over-expose the picture by one f-stop.

Blurred pictures can be caused by improper focus settings. But more often they stem from moving the camera as you snap the shutter. Never take a hand-held photo at a camera speed slower than 1/125th of a second. With practice, you might be able to take pictures at 1/60th or even 1/30th of a second, but most beginners should stay above 1/125th.

Shadows and colors—The camera captures images in two dimensions. It can’t discern a dip, which is a third dimensional feature. So how do you shoot the scene so the dip will show up?

The trick is using shadows. Take the picture just after sunrise when the sun is low in the sky. That will cast a shadow along the dip and make it look quite pronounced on film.

Remember, too, that film is tremendously sensitive to a wide spectrum of colors. Unfortunately, film is not particularly sensitive to varying shades of green. To capture patterns of green hues in a picture, you have to get a bit creative. Try waiting until there’s dew or frost on the grass; sometimes different grasses present distinctive dew patterns. You might also try different sun angles at different times of the day.

Most important, never take only one shot of something important. Film is cheap. But make sure you vary the camera setting each time.

—The author is research director for Jacklin Seed Co. He maintains a working collection of about 10,000 turf slides.

Optimizing turf health for football season

by Ken Mrock

You’ve got to be in great shape to stand up to a bear; in excellent shape to stand up to a team of them—especially when those Bears wear football uniforms and play for Chicago. So establishing and maintaining turf fields healthy enough to take all that punishment is a year-long task.

These are the procedures I follow to establish and maintain safe, playable turf.

Working closely with me is John Berta, assistant groundskeeper at Halas Hall, the Bears’ practice facility on the Lake Forest campus.

Spring—We start our spring program by pre-germinating a 50/50 mix of bluegrass and perennial ryegrass seed in 55-gallon drums. After drying, to make application easier, the seed is added to a small amount of our topdressing mix (calcified clay, shredded peat, sand and native soil).

As early in the spring as possible, we completely core aerify our fields in two directions with either a Ryan Reno-vaire or a Ryan G-A-30. This aeration relieves compaction and produces a suitable seed bed for our pre-germinated seed mix.

We allow the cores to dry, then break them up with a woven steel drag mat to provide topdressing across the field. The best topdressing is the existing soil structure. Since we have virtually no thatch on our fields, debris removal is unnecessary.

After the initial dragging, we broadcast the pre-germinated seed/topdressing mix into the sparse areas.

Next we use the slit-seeder and sow an ungerminated 50/50 bluegrass/ryegrass mix in two directions, forming a diagonal (diamond) pattern across the field.

Then we apply a starter fertilizer high in nitrogen and phosphorus (19-26-5). The nitrogen stimulates the existing turfgrass and the high phosphorus promotes seed development.

Next, we apply a granular pythium control to safeguard against seed pythium disease (damping off) and give the seed a better chance for establishment.

We then spot topdress, lightly covering those areas that have been desiccated over the winter. We cover the fields with Evergreen sports turf covers to speed seed germination.

The author is research director for Jacklin Seed Co. He maintains a working collection of about 10,000 turf slides.
At Scag Power Equipment, we’ve separated ourselves from the competition by manufacturing the finest line of commercial mowers you can buy.

Scag offers a complete line of commercial mowers – from rugged belt-drive walk-bahinds to durable hydro riders to our maneuverable new zero-turn walk-bahinds and riders.

We’ve innovated exclusive features like the dual hydro pump/motor drive system and counter rotation turning on our zero-turn walk-bahinds. Our cutter decks are deeper for a smooth, even cut every time. And our new mulching kit allows mulching at any time, without a dedicated deck.

We engineer each mower so routine repairs can be made on-site, with a minimum of tools. And we design all our commercial mowers to share many of the same components, so maintaining a parts inventory is less expensive.

Of course, other companies will tell you they’re as good as Scag, but that’s just a line. Contact Scag Power Equipment today and find out how a great line of commercial mowers can improve your profitability.

Simply the Best

Grid maintenance calendar

September
- Make a soil composition test
- Test soil pH
- Purchase fertilizer based on test results
- September-November
  - Before game:
    - Line the field
    - Mow 2-3 times per week, including morning of game
    - Water thoroughly in beginning of game week; sprinkle during week
  - After game:
    - Sweep divots; fill holes with pre-germinated seed/soil mix

October
- Fertilize at full rate
- Begin seeding thin spots with ryegrass before and after each game
- Post-season
  - Mow the field
  - Aerate
  - Dethatch (if needed)
  - Spread soil amendments
  - Drag field

Spring
- Fertilize
- Seed
- Pinspike
- Irrigate thoroughly

- Mow when spring growth starts
- Establish a mowing program
- Apply fungicide (if needed)
- Water
- Apply herbicide

Late March-Early Fall
- Apply fertilizer at 1/2 rate

Late May
- Apply fertilizer high in potash at 1/2 rate

May-July
- Slice monthly

June-August
- Watch for insects and diseases

Mid-August
- Core
- Fertilize at 1/2 rate
- Begin mowing pattern

Fall
- Irrigate thoroughly

- V Aerify
- V Mow when spring growth starts
- V Fertilize
- V Fertilize
- V Seed
- V Dethatch (if needed)
- V Core
- V Core
- V Begin mowing pattern

B&G’S NEW KP-4

Strap on the comfortable, lightweight KP-4 Knapack Sprayer and enjoy the convenience and mobility it affords. Designed for a multitude of uses, the KP-4 is tough enough for all sprayable solutions. Easy to use with the lever-operated high pressure continuous action pump. Only minimal effort is required to maintain effective spraying pressures. The generous 4 gal. high density polyethylene tank allows for an extended application period.

For more information about the KP-4 Knapack Sprayer or to inquire about all your spraying needs, call 1-800-544-8811.

B&G EQUIPMENT COMPANY
P.O. BOX 130, PLUMSTEADVILLE, PA 18949

Circle No. 104 on Reader Inquiry Card

Chemical resistant and heavy duty construction features include:
- All soft parts, gaskets and seals, superior quality.
- Unit converts for right or left hand operation.
- High pressure piston pump up to 90 psi. 4S in. hose.
- Discharge valve with screen and lock-on clip.
- 18 in. angled extension with pin to cone spray pattern tip.

OPTIONS
- Brass extensions
- Fan spray pattern tips, brass and poly.

New broad spectrum Curalan DF controls eight diseases without harm to turf so turf managers can sleep nights.

Two-way protection
Like Curalan flowable, Curalan DF gives you the option of preventive and curative treatments by adjusting the application rate.

Labeled for all turf grasses
You can apply Curalan to any turf grass variety, at any stage of growth without concern for injury.

DF formulation is easy to use
Curalan DF is easy to handle and leaves less residue in the jug.

Now there's new Curalan™ DF fungicide.

Simple solutions to complex problems
For more information call 1-800-878-8060

INFO CENTER

UTILITY VEHICLE SAFETY...A nine-minute video on AMT utility vehicle safety is included with each Deere & Co. AMT626 retailed in North America. Additional copies are $15 for either English (#DK-VHC91580EN) or Spanish (#DKVHC91580ES) versions. To order a 1/2-inch VHS cassette, phone: (800) 544-2122 or send check to AMT Safety Video, Deere & Co. Distribution Service Center, Safety Films Dept., 1400 13th St., East Moline, IL 61244. Illinois residents add 6.25% sales tax, Iowa residents add 4%.

LANDSCAPE DESIGN...Using a little imagination and Mike Munro’s “Northwest Landscaping,” even a beginner can create a unique and spirited expression of his lifestyle in his own backyard. The book includes eight pages of color photos, 50 how-to illustrations and a comprehensive plant glossary. The book is available directly from the publisher for $16.95 plus $2.50 postage and handling. To order, write Alaska Northwest Books, P.O. Box 3007, Bothell, WA 98041; or call (800) 343-4567 (206-487-6100 in Seattle).

ALCA MEMBERS...To get the Associated Landscape Contractors of America membership directory, non-members should send $26.50 to: ALCA Publications, 12200 Sunrise Valley Dr., Suite 150, Reston, VA 22091. ALCA members receive a $20 discount on the directory.

CONSUMER EDUCATION...With a “This Precious Earth” videotape and “Our Precious Planet” brochure, you can easily and professionally show how beneficial turfgrass is for the environment, and how sod can provide almost immediate benefits. The six-minute video and four-color brochure are available from the American Sod Producers Association: $25 for the tape, $75 for 500 brochures or $250 for 2000 (specify flat or folded). To order, write or phone ASPA: 1855-A Hicks Rd., Rolling Meadows, IL 60008; (708) 705-9898.

LANDSCAPE PLANTS...Dr. Carl E. Whitcomb's book "Establishment and Maintenance of Landscape Plants" has just been revised. The new version contains an added section on large landscape containers and roof-top gardens, along with an even wider array of practical techniques. For a copy of the 621-page book, send $38 to Lacebark Inc., P.O. Box 2383, Stillwater, OK 74076.

PRO TURFERS..."The Professional Turfgrass Management Guide for Massachusetts, 1992" is available from Bulletin Center, Cottage A, Thatcher Way, University of Massachusetts, Amherst, MA 01003 for $5.50 (shipped fourth class) or $6 (shipped first class). The guide was written by UMass Cooperative Extension turfgrass specialists. Reduced rates affect orders of 25 or more copies. Call (413) 545-2717 for bulk ordering information. Make checks payable to the University of Massachusetts.

FREE POSTER...ICI Professional Products is offering a free Crusade turf insect poster that can help golf course superintendents identify major pests in turfgrass. The large, four-color poster features detailed illustrations of seven major turf insects, along with information and charts on the optimal time to scout and treat for each pest. To receive your poster, call ICI at (800) 759-2500.
Today's Woods line has branched out to include over 50 proven products... all rooted in the same tradition of innovation, quality, value and service that began when we introduced the first tractor powered rotary mower in 1947.

Engineered and manufactured at our plant in northern Illinois, Woods mowers, cutters, scraper blades, backhoes and other specialty products are known for superior performance and rugged reliability.

They're the first choice of commercial users, farmers and home owners when quality, value and service count most.

Discover how the Woods family tree of proven performers can work for you. Send for your free copy of our Full Line Catalog today.

No Other Grub Control Program Has Ever Sounded This Good.
Control grubs before they damage your turf while minimizing the impact on the environment.

If you think that sounds good, then call for our free audio tape and brochure.

Each tells you about this pre-damage strategy and how to implement it. From scouting for signs of grubs to timing your applications.

Also, they show you how well DYLOX Insecticide fits in a pre-damage program. DYLOX works fast to control all species of white grubs. Plus, DYLOX goes away quickly, reducing the long-term risk to the environment.

For your free tape and brochure, call 1-800-842-8020. Or write Miles Inc., Specialty Products, Box 4913, Kansas City, MO 64120.

The call is free. The tape and brochure are free. All we ask is that you lend us an ear.

Summer turf fertilization relies on balanced nutrients

by David Wehner, Ph.D.
University of Illinois

Summer fertilization can help provide a strong, healthy turf when demands on the grass are the greatest. The key is understanding how the plant grows when temperature and moisture may not be optimum, and adjusting fertilization accordingly.

Too much fertilizer in the summer can decrease turf stress tolerance and increase occurrences of some diseases. Too little fertilizer will result in turf with poor recuperative potential, and, in some cases, turf unable to compete with summer germinating weeds.

Turf managers must strike a balance between the two extremes.

Understand plant growth—Cool-season turfgrasses generally show best shoot growth in air temperatures of 60 to 75°F and best root growth at soil temperatures of 50 to 65°F.

As temperatures increase from these ranges, growth slows and eventually, at a high enough temperature, stops.

This is probably because, at the higher temperatures, the plant uses more of its food supply (referred to as carbohydrate reserves) than it produces. There isn’t enough available for sustained root growth. Also, nitrogen applications cause the shoot system to grow preferentially over the root system.

Nitrogen applications, then, can make a bad situation worse by further reducing energy available for root growth.

Most turf managers also realize that, as water becomes limited, growth declines and then stops. It’s important to limit nitrogen applications during times of drought stress. Conversely, a moderate nitrogen application can help a plant recover from drought-induced dormancy.

Warm-season grasses, which exhibit optimum shoot growth at air temperatures of 80 to 95°F and best root growth at soil temperatures of 70 to 85°F, are easier to deal with, since they are growing at their peak over the summer months. They have more efficient photosynthetic mechanisms, and are more drought tolerant than cool-season grasses. However, they still need water. Too much fertilizer should be avoided during very dry periods.

Designing N programs—In designing an N fertilization program, match nutrient applications to the plant’s growth. That is why you should apply more fertilizer in the fall and spring when the plants are actively growing than in the summer. However, to maintain some growth during the summer,

The turfgrass manager can approach summer N fertilization by either making several small applications of a quick-release N source or by applying a slow-release N source.

In situations where the turf manager is located at the site, apply 0.25 to 0.50 lbs. of actual N per 1000 sq.ft. from a quick-release fertilizer during the summer when it is necessary to increase the turf’s growth.

The alternative strategy is to apply a slow-release fertilizer (1 to 2 lbs. of actual N per 1000 sq.ft.) early in the summer. This may be more feasible where it is diffi-

A substitute?—Another approach to summer fertilization is to use foliar applications of iron to improve color without stimulating excessive growth.

In our research, we were able to reduce the amount of N and get equivalent color by including iron in a foliar spray with N.
Granular control for insects. Because you never know which way the wind will blow.

To control surface and soil insects as you feed, nothing works harder than Lebanon granular fertilizers with DURSBAN* insecticide. They spread evenly, without drifting or leaching through, to eliminate chinch bugs, ants, weevils and fleas, as well as ticks that can carry lyme disease.

Apply the homogeneous, balanced feeding of Greenskeeper 20-4-10 with DURSBAN insecticide for even growth and color. Or the economical, yet highly effective, SCU blended Lebanon Pro 20-3-5. Available with DURSBAN insecticide in 1% and 0.6% formulations.

For more information, contact your Lebanon sales representative or local Lebanon Turf Products distributor. Or simply call 1-800-233-0628.
Applications of 1 to 2 lbs. of actual iron per acre to Kentucky bluegrass resulted in a darker-green color that lasted for several weeks depending on the grass’s growth rate (the faster the growth, the shorter the response period). Because of this, it may not be feasible to use iron where the turf manager is not able to frequently monitor results. Also, iron is more expensive to use than nitrogen.

Several considerations relative to using iron are listed in Table 3. Note that iron is not a replacement for a sound N fertilization program but rather a supplement. Experiment with application rates to determine what provides the best results for the species of grass and conditions that you are working with.

Healthy plants—Insect or disease problems can further reduce the plant’s ability to withstand stress periods. This is particularly important when diseases affect the roots, as is the case with summer patch and necrotic ring spot on Kentucky bluegrass, or where nematodes may be present. Compact or water-logged soil will reduce rooting, thus weakening the plant.

Researchers have observed stress problems where soil phosphorus has declined to low levels, such as on creeping bentgrass putting greens where phosphorus was withheld to help combat annual bluegrass encroachment.

Also, the plant must have enough phosphorus and potassium. Researchers have observed stress problems where soil phosphorus has declined to very low levels, such as on creeping bentgrass putting greens where phosphorus was withheld to help combat annual bluegrass encroachment.

Soil tests should be taken every two to three years to monitor pH and nutrient levels.

Strategy for success—By starting with a healthy plant and carefully matching fertilizer applications to existing growing conditions, the turf manager can ensure that the turf stand will survive the summer stress period with minimal problems.

—Dr. Wehner is an associate professor of horticulture at the University of Illinois at Urbana-Champaign.

Addendums to fertilization, insect control

- The insecticide Crusade was inadvertently omitted from the cool-season insect control article in the April issue of Landscape Management.

Crusade is registered for control of insects in professional turf areas such as golf courses and commercial sod growing areas. Applied in the spring, summer or fall, at 4 lb. ai/acre, it is effective against white grub larvae such as Japanese beetle, black turfgrass ataenius, chafers, *Phyllophaga spp.*, green June beetle and Asiatic garden beetle. At 3 to 4 lb. ai/acre, Crusade is also labelled for controlling chinchbugs, cutworms and sod webworms.

All applicable directions, restrictions, and precautions on the EPA-registered label are to be followed.

—Harry D. Niemczyk, Ph.D.
Professor Emeritus
OARDC/Ohio State Univ.

- In the February issue of Landscape Management on page 24, you show residual N activity of Nutralene at only 7 to 9 weeks. This statement is in gross error: actual residual is 10 to 16 weeks.

—James H. Taurasi
Jayson Associates (agent for Nor-Am)
Winchester, Mass.
ROUNDUP® HERBICIDE PRICE DROPS AGAIN!
2½'S NOW...

You read it right! Roundup® herbicide has dropped its price right through the floor for the second straight year. Now the suggested retail price of a 2½ gallon container of Roundup is a full 39 dollars less than it cost just two years ago!

That big price cut spells big opportunities for you to stretch limited budget dollars with lower-priced Roundup. Replace costly, time-intensive string trimming with quick, inexpensive spray trips. Maintain more weed-free beds, pine islands, tree rings and grounds for less than ever before with Roundup.

Spend less and do more with lower-priced Roundup. See your dealer or retailer to stretch your budget dollar.

Always read and follow the label for Roundup® herbicide. Roundup is a registered trademark of Monsanto Company. ©Monsanto Company 1992 RIP-3-170B
TruGreen/ChemLawn deal widens gap between the biggest and the rest

ChemLawn, Columbus, Ohio, becomes part of SVMQ.

ServiceMaster buys huge chunk of pro lawn care market; thinks baby boomers will have more $$$ than time.

ServiceMaster Quality Service Network (SVMQ), Memphis, Tenn., is now the nation's professional lawn care leader.

It happened May 20th with its purchase of the operating assets of ChemLawn. The cash purchase price was $50 million plus the book value of net tangible assets of $54 million. TruGreen signed a letter of intent in late April, about two months after Ecolab put ChemLawn up for sale.

The SVMQ consumer service network, which includes TruGreen, has grown to:
- more than 3,000 cleaning franchises,
- the Terminix termite and pest control services,
- almost 500 maid operations, and
- American Home Shield with its 40 percent share of the U.S. market in home appliance warranty and repair.

C. William Pollard, chairman of ServiceMaster, noted that after an initial transition period, the two companies will be combined into one operation. Pollard added people from both companies would be merged into the single larger company.

“We’ve moved from being No. 3 to No. 2,” wryly observes Patrick Norton. Norton’s Barefoot Grass Lawn Service recorded sales of just more than $50 million in 1991. It trailed just ChemLawn and TruGreen in sales.

Big is bigger now—There will be an even bigger gap between the new lawn care market leader and the rest of the industry. ChemLawn had net sales of $355 million in 1991, and TruGreen about $92 million.

“They (ServiceMaster) were about the only ones in the industry able to bite off that much,” comments Bob Andrews, president of the Professional Lawn Care Association of America.

A TruGreen/ChemLawn combination will have 20 to 25 percent of the residential lawn care market which a 1991 Lawn Care Industry magazine survey estimated at $2.1 billion. (ChemLawn historically has said it has a bigger share of the residential market.)

continued on page 40
A revolutionary leap in the evolution of mowing.
To see where rotary mowing is headed, take a good look at the sleek new Jacobsen HR-5111. It delivers an 11'-plus, high-production cut and exceptional trimability in a rugged four-wheel-drive package.

Built for long life in rough country.
Hydrostatic 4WD, a heavy-duty axle with differential lock, and a reliable, fuel-efficient, 51-hp diesel let the HR-5111 confidently tackle tough hills that stall the competition.

Our new box-channel steel, straight-line frame takes the pounding of tough conditions like no other mower in its class. Plus, the full-fiberglass body keeps its good looks for years, even in the harshest environments. And it's all backed by a 2-year, 1,500-hour warranty.*

No belts. No pulleys. No kidding.
Our revolutionary, fully hydraulic cutting system eliminates the maintenance and adjustments of belt-driven units. It incorporates individual, lifetime lubricated spindle motors which deliver more power to knock down tall, heavy grass, for a clean 1" to 5½" cut. The decks have a unique, counter-rotating spindle configuration producing the smoothest rear discharge going.

Smooth operator.
From the easy-to-read, full instrumentation, to the ergonomic controls, the HR-5111 redefines operator convenience. What's more, power steering, tilt wheel, cruise control and the adjustable high-back suspension seat keep the operator comfortable, for a more productive day.

For high productivity, 4WD mobility, heavy-duty durability and operator comfort, there's nothing like the HR-5111 on turf. So be sure to ask your Jacobsen distributor for a demonstration today.

THE PROFESSIONAL'S CHOICE ON TURF.
Both companies are in most lawn care markets already. ChemLawn operates in 45 states and TruGreen in 23.

"I don’t see it (the purchase) as having a tremendous impact, not yet anyway," says Andrews.

Adds Barefoot’s Norton: "If someone had come into the industry from the outside then, I think, we’d see a bigger impact."

SVMQ’s growing presence in diverse consumer service markets are well documented. To date, it’s been enviable successful too.

**ServiceMaster keeps growing**—In 1990, SVMQ increased its ante in consumer services by buying TruGreen and a network of pest control operations from Chicago-based Waste Management (WM retains 22 percent ownership). That deal was pegged at about $180 million, by industry insiders.

Later that year, in a press conference, SVMQ President Carlos Cantu said ServiceMaster operates on the premise that "people are time-poor and money-rich, and they need the services we (SM) will be offering the marketplace."

He said that 40 percent of the U.S. population was born between 1946 and 1964. This represents 53 million households, with a median income of about $50,000 and a median house value of about $105,000. SVMQ’s research indicates 60 percent of this target market is made up of two-income families.

Also, SVMQ, reportedly, was heartened by TruGreen’s operation in 1991, the one full season it owned it.

“It may take two or three years for ServiceMaster to convert the lawn care over into a single operation,” muses industry consultant Ed Wandtke of Wandtke & Associates, Inc., Columbus, Ohio.

“The real question may be, can the tail (TruGreen) wag the dog (ChemLawn)?” he wonders.

Adds John Buechner, of Lawn Doctor in Matawan, N.J., “I think the acquisition is an interesting project, but only time will tell how it affects the industry.”

—Ron Hall

---

**No more ChemLawn to kick around (or imitate)?**

- ChemLawn, a name synonymous with professional lawn care, is a name in eclipse.
  
  What seemed inconceivable a few years ago may happen. ChemLawn may cease to be—at least as ChemLawn.

  Late this past winter, Ecolab, owner of ChemLawn since 1987, put the “For Sale” sign on the company that laid the foundation for a $2 billion-plus industry. ChemLawn: the most closely watched, copied, competed against and, increasingly, condemned company in the industry.

  TruGreen’s pending purchase of ChemLawn raises questions that neither TruGreen nor ChemLawn officials would discuss, pending completion of the sale. Among them:

  - How will TruGreen absorb the three-times larger ChemLawn? Is the ChemLawn name itself an asset or a liability? Or both?
  - Will ServiceMaster Quality Service Network, of which TruGreen is a part, continue to buy lawn care companies to expand its share of the professional lawn application market?
  - What happens to ChemLawn’s new and heavily promoted EcoScape full-service landscape care?
  - How will TruGreen deal with competing sister operations, specifically franchises? For the last eight years, ServiceMaster Lawn Care has been growing a network of franchises (more than $4 million in sales in 1988). Many of them compete against TruGreen branches and/or ChemLawn branches or franchises. In 1991 TruGreen began buying and folding in SM franchises.

  "If they’re in competition and want to sell their business, they don’t have to go shopping,” a source close to SM tells LANDSCAPE MANAGEMENT.

  - Whose management and service pricing philosophies—ChemLawn’s or TruGreen’s—will emerge? TruGreen, fairly or not, has typically been perceived by competitors at pricing at the lower end of the spectrum.
  - Will TruGreen/ChemLawn operations use the herbicide 2,4-D? ChemLawn hasn’t for several years. (Several other large companies have quietly quit using 2,4-D also.) TruGreen reportedly does.
  - Will TruGreen/ChemLawn work with the rest of the industry—which, broken into individual parts, are overwhelmingly gnat-sized compared to the ServiceMaster operations?

—R.H.
Dependable, economical post-emerge control

Crabgrass, Nutsedge
Plus the truly hard-to-control broadleaves

Read how Trimec® Plus, with its unparalleled broad spectrum control, fast action, and gentleness to desirable grass, is helping turf professionals improve their environmental stewardship and reduce their chemical costs.

Everett Mealman
Chairman and Chief Executive Officer
PBI/Gordon Corporation

The environmental age weed control program being used by Roger Albrecht is typical of progressive turf professionals.

Albrecht is president of Nitro-Green Corporation, which has 38 lawn care franchisees scattered over 15 different states, and he manages two locations in California for his own hands-on experience.

“Our goal is to eliminate all broadcast spraying of herbicides on the ornamental turf we manage, and replace it with spot treatment as necessary,” says Albrecht. “We want to be pro-active on environmental issues and be able to assure our customers that we are using the absolute minimum requirement of chemicals.”

Albrecht goes on to explain that such a program takes time to implement because the turf needs to be so healthy and thick that weeds cannot easily germinate.

“The elimination of the pre-emerge broadcast is the critical step,” says Albrecht, “because, no matter what, some crabgrass is going to appear, and since crabgrass is a major cause of complaints, we must be able to eliminate it fast with no discoloration.”

Trimec Plus provides the safety net that enables Albrecht to eventually eliminate pre-emerge. “We have absolute confidence in Trimec Plus to handle any crabgrass or nutsedge that shows up,” says Albrecht.

And, of course, the same spot sprayer filled with Trimec Plus that Albrecht uses to control crabgrass and nutsedge also controls the other grassy and broadleaf weeds that can germinate throughout the year. “Having one herbicide for all of our spot treatment is a major factor in our program,” says Albrecht.

But if Trimec Plus is ideal for spot treatment, it is also unsurpassed for broadcasting when the need exists. Listen to George Toma, the executive turf consultant for the Royals, Chiefs, and NFL:

“My son, Chip, the groundskeeper for the Truman Sports Complex, used a broadcast of Trimec Plus on the out-of-sight, unirrigated perimeters of the complex, which was loaded with every conceivable weed, and Trimec Plus absolutely took out everything except the bluegrass.”

According to Toma, it would have taken four different selective herbicides to do the job that Trimec Plus was able to do... but even more important, Toma says that Trimec Plus did a better job on all of the individual species than a narrow spectrum selective could have done.

What is Trimec® Plus?
Trimec Plus is a unique formulation of Trimec Broadleaf Herbicide and MSMA in a stable, uniform suspension that is as easy to work with as any other Trimec Complex.

By all means give Trimec Plus a trial this season... especially on crabgrass, nutsedge, and clover. We assure you that your experience with Trimec Plus will give you the confidence you need to start working toward the elimination of broadcasting.

Introducing The Perfect

For overseeding low cut areas and establishing greens and tees, no other fertilizer provides the kind of coverage and nutrient distribution that Country Club 10-18-18 does.

It's All The Same.

When it comes to starter fertilizer, any turf manager worth his salt knows that homogeneous mixtures offer benefits that blends can't. Which is why every bag and every fine granule of 10-18-18 is exactly the same. Manufactured and tested under the strictest quality control measures. Insuring uniform color and growth from start to finish.

Ratios That Result From Higher Learning.

In developing the ratios for 10-18-18, we went back to school. Extensive university research on soil and tissue analysis goes into every bag of 10-18-18. Along with lower nitrogen content for slower growth. More phosphorus for better seedling germination and density. And
more potash for hardier turf.

The end result—an agronomically sound product that delivers unprecedented performance.

**Better Greens For Less Green.**

While Country Club 10-18-18 is certainly not one of the more inexpensive fertilizers, it is exceptionally economical to use. Because of its homogeneous formulation, 10-18-18 covers a whole lot more ground than several bags of a cheaper blend. Which makes it ideal for maintaining as well as establishing turf. And with 10-18-18's WIN content, there's also less leaching and volatilization.

For more complete information about 10-18-18, contact your local Country Club distributor or call Lebanon Turf Products at 1-800-233-0628.

Then carry our bags around your course, and find just how much they'll improve your game.

**Country Club 10-18-18**
Focus of lawn care in 1990s: customer, employee education

Well-trained, responsible employees are a company's best resource but consider newsletters, videos, and radio too.

by Brad Johnson

- Leaving customer expectations to chance is risky business.
  That's because the uneducated customer often builds unreasonably high expectations. No wonder. Some lawn care companies advertise that all customers have to do for a beautiful lawn is to mail them a check every two months. When the lawn doesn't live up to these expectations, customers, particularly new customers, don't perceive professional service as having value.

Lawn care business people now realize they must educate customers as well as treat their lawns.

They must educate them concerning the value they're receiving.

It benefits both parties. Customers must often work with the lawn professional to secure an attractive, healthy lawn. For instance, lawn professionals need continuing customer cooperation with mowing and watering. That's when a customer begins to receive real value from the lawn professional's service.

The professional provider builds on customer education and communication in addition to attempting to deliver a "weed free" lawn, one that is always greener than the one across the street—often while using less pesticides and fertilizers. This is a tall order, but that's what we're working toward.

Building bridges with your clients may not be as difficult as you think. Let's look at ways you can educate your customers and turn them into partners.

Newsletters—A newsletter is fun and fairly easy to do. Most customers will glance through it. Some will read it cover to cover. You can produce simple newsletters in-house for a fairly modest cost. However, to really attract customer attention, use a professional marketing firm.

Leave newsletters with customers with every application. You can also mail them to customers, but this is more costly.

Use newsletters to increase sales of add-on services. Be fair. Don't produce newsletters that have substantially more advertising than helpful information. You want your customers to learn something valuable about their lawns and landscapes while looking through your newsletters.

In addition to newsletters, you might consider:

Videos—We tried customer manuals, but customers often don't read them. This season we began using a professionally produced customer education video, "Side by Side."

The 15-minute video shows clients how to properly water and mow lawns. It also deals with two particularly frustrating problems for lawns in the transition zone, winterkill and spring dead spot. (You may want to customize your video to deal with other issues.)

When a new customer signs up with us, we send them a welcome card, do their first application, and leave a copy of the video in their invoice bag.

We also include a short survey for them to fill out after they watch the video. To answer the survey, they have to watch "Side by Side," since answers to the ques-

Little things mean a lot

- Little things your people can do every day add up to better-educated, loyal customers.
  - Take the time to talk to customers, either in person or on the phone.
  - Call customers to ask if there are any questions about their lawn or your service.
  - Write personal notes on invoices each time an application is done.
  - If the customer is not watering and mowing properly, tell him or her, and leave information on proper watering and mowing.
  - Leave fact sheets on special problems a lawn may have, such as soil compaction, disease, thin turf, etc. Follow these up with phone calls.

—B.J.
For 30 years, Landscape Management has been your Green Industry source for Business Management "How-To" Technical Information, and Industry News.

Now that we include Lawn Care Industry's coverage of the LCO segment, you have more reasons than ever to read LM and... PASS IT ON!

Your crew, a partner, technicians or even customers... LM's editorial, useful, timely and understandable will help you and other professionals with your work, and in promoting the benefits of healthy attractive turf.
Many LCOs now use professionally produced newsletters to keep their clients informed.

Our employees—All the video, newsletters and radio shows, will have limited effectiveness without quality, well-educated, motivated employees. There is no substitute for just good, old-fashioned face-to-face communication.

That's where we need to spend the most time and money, in encouraging and educating our employees first. Employees can then begin to educate our customers.

Market saturation, increased regulation and pressures from anti-pesticide group is, a more demanding customer base—these are the reasons why we must educate and become partners with both our employees and our customers.

—Brad Johnson is president of green up! Lawn Care Services, Tulsa, Okla. For more information about customer education videos, contact him at (918) 250-3898.
Agriform™ Planting Tablets now contain all the minor elements your plantings could ever need, as well as Nitrogen, Phosphorus and Potassium.

More importantly, the minor elements in Agriform Planting Tablets are in a Sulfate form. Sulfates are superior to the Oxide forms used in other tablets, because Sulfates are more readily available and more usable by plants.

Best of all, Agriform Planting Tablets with Minors cost no more than other tablets. It's like getting supreme, for the price of regular.

Get new Agriform Planting Tablets — now with Minors. They're easy-to-use, safe, and long-lasting — up to 2 years of continuous root-zone feeding.

See your Grace-Sierra distributor today. Or call us toll free: 1-800-492-8255.

Agriform Planting Tablets with Minors. They'll help you make major improvements in your plantings.

Landscaper unearths ancient bones

Illinois State Museum identifies dinosaur remains.

WADSWORTH, III.—Van Zelst Landscaping turned preservation of a wetland area into a national news event when mastodon bones and tusks were discovered in the excavation to expand a small marsh into a larger lake.

The 10,000-year-old bones were discovered along with the remains of an ancient spruce forest which existed on the site during the Ice Age, according to David Van Zelst.

The bones, tusks, shells and spruce tree trunks were found on Van Zelst’s property as it was expanding a tree nursery site and excavating a three-acre lake to provide for a continuous source of water.

The first piece of bone excavators came upon was almost four feet long with a cross section of about 4-by-7 inches. What appeared to be a tree stump was the femur (right thigh bone) of a prehistoric American mastodon.

Van Zelst contacted the Illinois State Museum in Springfield. A team of scientists led by Dr. Russell Graham, curator of geology, arrived the next day. Graham identified the bone as part of the beast which stood 10 feet tall at the shoulders and weighed up to six tons.

A section of tusk ivory about 24 inches long was also found, along with the remains of a grove of spruce trees believed to be about 11,000 years old. Tree trunks and white spruce seed cones are neither decomposed nor petrified. After carbon-14 dating and tree ring studies, these specimens are expected to tell the history, climatic and season conditions at the time of growth. Pollen studies are also being made.

Van Zelst with a hunk of a mastodon’s thigh bone originally thought to be a tree trunk. He found it in a 15-foot-deep excavation in Wadsworth, Ill.

Ban pesticides in refuges? It’s not an issue, say feds

WASHINGTON—Pesticide use could be banned in all of the U.S. National Wildlife Refuge System.

That’s one suggestion of several environmental impact “alternatives” being considered by the U.S. Fish and Wildlife Service (FWS).

Some of these alternatives will likely be incorporated into a new management plan for the refuge system later this year—but only after the FWS weighs input from a series of public hearings.

Most comment from the public so far has been from hunting, trapping and fishing interests seeking continued access to federal lands.

Pesticide use on federal refuges is, to date, not a burning issue, apparently because of the FWS’s use and oft-repeated endorsement of integrated pest management (IPM) practices.

Several FWS “alternatives” would continue to allow pesticide use on national properties, but only in IPM programs.

Actually, pesticide use on national refuge property has dropped dramatically since 1974 anyway—about 40 percent in 20 years, claims the FWS.

In 1989 the FWS says it used pesticides in 61 refuges, on 202,000 of a possible 90 million acres in the national refuge system.

Ongoing debate continues: posting for D-I-Yers or not?

MARYSVILLE, Ohio—The debate continues over whether do-it-yourselfers (in most cases, homeowners) should have to post lawn pesticide applications in the same manner that their professional counterparts must, in many areas of the U.S.

The most recent opinion was received at LANDSCAPE MANAGEMENT in a letter from Dr. Michael P. Kelty, vice president of research and development for The Scotts Co. Here is what Dr. Kelty wrote:

“As the nation’s largest supplier of do-it-yourself lawn and garden products, The Scott Company agrees that homeowners have every right to be fully informed of the products and services they purchase. We are opposed to mandatory D-I-Y posting and pre-notification, however, and present the following as support:

• “Products registered for residential application by LCOs or D-I-Yers are, to my knowledge, all ‘General Unrestricted Use’ products. This is EPA’s most benign risk category. Our experience in nearly 100 years of supplying the turfgrass market shows that EPA’s classification scheme is appropriate.

• “D-I-Y consumers receive an EPA-approved and/or a state-approved label for the fertilizer and pesticide products they purchase. These labels fully disclose the product contents, etc. In the case of The Scotts Company (and other D-I-Y suppliers), a toll-free number is provided on all product packages so that assistance from trained technicians is readily available. To my knowledge, LCOs are not required to provide similar product/service disclosures under FIFRA, but several states do have disclosure standards.

• “With a good history of safe use and with a federally-mandated disclosure system already in place, we feel that posting and pre-notification for D-I-Y products is superfluous. Further, a consumer posting and pre-notification system is impractical to implement and virtually impossible to enforce.

• “D-I-Y consumers continue to reside in the neighborhood after they’ve applied their products. It seems to me that a neighbor who wants to be notified of product application will receive that information more effectively by knocking on his/her neighbor’s door than by instituting a costly and unnecessary consumer posting and pre-notification system.

“Scotts strongly endorses freedom of choice. If LCOs, notably the Professional Lawn Care Association of America, feel that posting and pre-notification laws are appropriate, they should be free to pursue them. It does not logically follow, however, that LCOs’ endorsement of these laws makes them appropriate for consumers.

“Consumers should continue to have the choice of D-I-Y or LCO. Neither method is toxicologically or environmentally better, but a simple matter of choosing what is the best value for each individual. Both application methods and their related products have a role to play in serving customers.”

THE WORST PART ISN'T
THAT SHE'S CALLED BACK
THREE TIMES, OR THAT
SHE PROBABLY WON'T RENEW.
THE WORST PART IS THAT
SHE'S GOT NEIGHBORS.
If she's calling you about grubs, fire
ants, or mole crickets, you can bet her
neighbors are hearing about you, too.

Makes you wish you'd used Triumph, doesn't it? You could have delivered up to
90% control in just 2 to 3 days. Too bad.

Bet you'll use Triumph first, next time.

OVERLAND PARK, Kans.—The current
definition of macro-nutrients (aside from
C-H-O) for turfgrass fertilization consists
of nitrogen, potassium and phosphorus,
and represents those elements historically
accepted as required for a "complete" fer-
tilizer.

In this letter to LANDSCAPE MANAGEMENT,
Dan Nason, marketing manager for potash
products at Great Salt Lake Minerals Corp.
here, thinks another should be added:
"As a turfgrass specialist for the past 15
years, I have been interested in the nutri-
tional needs of turfgrass in order to main-
tain optimal health and minimize the neg-
ative impacts of a wide array of stressful
situations.

I suggest that in the specific case of
turfgrass nutrition, there are four—not
three—primary nutrients which are criti-
cal to the healthy completion of the nor-
mal life cycle. Sulfur should be the fourth
major nutrient required of turf fertilizers
before they should be termed 'complete.'
"Sulfur is usually found in tissue analy-
ses of healthy turfgrass in amounts greater
than that of phosphorus. Sulfur in the
plant-available sulfate form is also gener-
ally much more lacking in most soils than
are the other two 'secondary nutrients,'
calcium and magnesium.

"The nutritional value of sulfur in tur-
grasses has been overshadowed for far too
long by sulfur's use as a soil amendment
to modify soil pH, yet sulfur is responsible
for a great number of plant processes of
particular importance to turfgrasses ver-
sus other crops. Sulfur is a major factor in
turf's ability to provide for improved
drought tolerance, winter hardiness, color
and density; this is in addition to its
important role in many metabolic func-
tions which are commonly accepted as
beneficial for other plant groups.

"Turfgrass management and so turf-
grass fertilizers have evolved as an off-
shoot from strictly agricultural models.
Maybe it's time we turfgrass managers rec-
ognize and treat turfgrasses as the unique
'crops' they are.

"The N-P-K-S designation for a 'com-
plete' turf-type fertilizer will be of far more
value to serious turf nutritionists.
Consumers also should have every right to
expect the 'complete' fertilizer they buy for
lawn is just that: complete with the four
basic nutrients most important and most
often found lacking for optimum turfgrass
health and nutrition."

Joint-venture subsurface products designed to save landscape water

Amid an industry-wide scramble for solutions to national and global water shortages, a new line of products from Toro Irrigation is designed to preserve landscape beauty and reduce water use.

"Water conservation and attractive landscapes are compatible," says Steve Snow, the company’s retail and new business manager. "We think this is a major step in getting answers to irrigation problems from a single source."

Components of the new line are subsurface drip irrigation, drip irrigation, microspray, a high-flow shut-off device, a Rainswitch, new controllers, an adjustable stream rotor nozzle and Flo-Pro valves.

“We have formed strategic partnerships with a number of industry leaders so that we can offer a full selection of irrigation products.” Snow relates. “Some of it is Toro technology. But the biggest part comes from strategic partnerships with companies like Netafim, the world leader in drip irrigation.”

- Subsurface drip irrigation products put water at the plant rootbase, where it’s most needed.

“Drip irrigation is coming up in conversations with contractors more and more,” Snow contends. “There’s a demand for irrigation solutions to odd shapes, against buildings and in high wind areas, for example. Square and rectangular landscapes are not as common as they’ve been in the past. And sprinklers are just not designed for some of those areas.”

Both of Toro’s surface and sub-surface drip systems offer a complete line of components, including fittings, pressure regulators, filters and tubing.

- The microspray is designed for use in small or narrow planting areas with a radius of 3 to 10 feet, or in color beds with fragile plantings. Features include flush mount micro bases which retrofit to any Toro 570 pop-up body or shrub adapter. Other features are:
  1) pressure compensation to provide uniform application over elevation changes and long runs;
  2) low flow and precipitation rate to reduce runoff in tight soils; and
  3) six nozzle patterns and color-coded bases.
- The high-flow shut-off device reduces water flow to a damaged or vandalized sprinkler without interrupting the remaining irrigation system. It delivers no more than 1/2 gallon per minute within 60 seconds and is easy to install.
- The Rainswitch, which requires no maintenance or cleaning, suspends irrigation during rainfall.
- Toro’s new controllers include three commercial/government central control systems featuring radio capability. All controllers feature long run times for low volume irrigation.
- The new Omni adjustable nozzle for Toro’s stream rotor sprinkler increases ease and flexibility in design and installation.
- And the company’s Flo-Pro valves are adjustable from 0.25 to 30 gallons per minute. Various body configurations are available.

“These give Toro Irrigation the most comprehensive product lines in the business,” Snow concludes.

TechLine makes it possible to irrigate curved, angular, narrow median strips without overspray and water run-off.
Diffused-air system cleans lakes of five or more acres

Otterbine/Barebo, Inc. now offers a diffused-air aeration system to its line of water management products. According to the company, the product also fights purpling due to a cold-induced phosphorus deficiency on established turf.

Air-Flo aerates and circulates water in lakes that are a minimum 12- to 18-feet in depth and cover five or more acres, reducing aquatic weeds and algae without disturbing the natural surroundings of the lake environment.

Otterbine/Barebo says the diffused air aeration system is efficient and inexpensive in both capital and operational costs, and requires minimal maintenance. Operates at 115 volts.

The system is silent, with no splashing, electricity or moving parts in the water. The Air-Flo retains the integrity of the lake's natural surroundings, and provides effective bottom to top mixing, and breaks down thermal stratification.

Utility truck equipped with many user accessories

Jacobsen utility trucks are versatile enough to accommodate a variety of operator safety and comfort accessories.

For all-weather protection, a full cab with windshield wiper is available on all three-quarter and half-ton Jacobsen trucks. All four models can also be equipped with front and rear turn signals.

Jacobsen's gas and electric Express trucks can be fit with a canopy with a protective ball cage with plexiglass windshield. For added safety, a light bar kit is available for both models. An hour meter can be added to both. A charge meter is available for electric-powered trucks.

Fungicides now available in dry-flowable formula

Sierra Horticultural Products Company has introduced Vorlan turf fungicide and Fungo systemic turf and ornamental fungicide in safe and convenient dry-flowable forms. New Vorlan DF and Fungo 85 DF provide excellent control of key diseases, including brown patch, fusarium blight, summer patch, necrotic ring spot and anthracnose. The dry-flowable forms are easy to dispense and packaged in small, space-saving cardboard boxes that do not require special disposal services.

One of the most difficult tasks for a lawn service company is making time to follow up on customer service calls during the busiest times of the year. These scheduling conflicts will not disappear, but the following tips will help you to weather the customer service pressure easier:

1) Use the team approach. The team approach means that any employee is able to solve a customer service problem that's brought to their attention. Whenever a customer who needs help calls, the office can dispatch the nearest available service technician, even if the customer is not his.

2) Review the nature of service requests. When customer service requests and service delivery requirements are the highest, it is important to review and rank the type of customer service request being received. Take the time monthly or biweekly to review and discuss the nature of service call requests and what can be done to reduce them. Use this review period as a time to reinforce your company's commitment to delivering the best service the first time you are on a customer's property.

3) Focus on quick attention to a service call. Much of a lawn service company's customer service pressure comes from not attending to service calls on a timely basis, or from not communicating with the customer. Implement a "minimum response-time policy." Then put in place a system of written follow ups for the service calls to make certain the customer is satisfied with what you did to solve their service call request.

These customer service systems will help relieve customer anxiety over delayed follow-up. The team approach helps you provide the service you promise in the contract, and demonstrates your commitment to their satisfaction.

In addition, your employees will be more comfortable knowing that your commitment to customer service is based on the trust and confidence you have in their ability to solve a customer's problem.
Avoid Running Into Problems.

Announcing a turning point in mower history. The Reelmaster® 216 from Toro. It's nimble. Lightweight. And extremely maneuverable. Perfect for mowing around trees, signs, any obstacle standing in your way. And perfect for formal mowing and cutting on slopes.

For added performance, traction and versatility, the Reelmaster 216 features 3-wheel drive. Plus quick-adjusting height of cut. Options include grass catchers and a choice of front rollers that let you adapt easily to varying needs.

The Reelmaster 216 is so easy to operate that anyone can become an expert on the first ride. One lever controls the cutting reels. One pedal controls the forward and reverse speeds and the braking. It's that simple.

For all-purpose mowing, there's nothing as agile as the Reelmaster 216 from Toro. It's a great way to steer clear of trouble. For a demonstration, call your local distributor or contact Toro at the address below.

FORMULATORS OF CHEMICAL FERTILIZERS AND HERBICIDES
PRIVATE LABEL AND PACKAGING IS OUR BUSINESS
Wherever You Need A Low-Maintenance Turf Rely On Reliant

Roadsides, cemeteries, golf course roughs, vacation homes, orchards, reclamation areas. Wherever maintenance is impractical, Reliant Hard Fescue is the one you can rely on. It thrives on low maintenance:

- Good performance without supplemental irrigation
- No fertilization needed (after initial establishment)
- Low growing
- Resistant to crabgrass encroachment
- Adaptable to full sun or moderate shade
- Improved disease resistance
- Tolerant to cold
- Dark green, leafy and fine-textured

Blend Reliant with other fine fescues. It’s ideal for poor, infertile soils. Or wherever a fragile ecology doesn’t allow fertilization. Reliant can be used on any area that’s mowed infrequently or not at all.

Rely on Reliant Hard Fescue — the high performance turf for low-maintenance areas.
