Barefoot buys Hydro Lawn

Barefoot, Inc., announced in mid-July that it had bought Hydro Lawn, Inc., based in Gaithersburg, Md.

Barefoot is the nation’s second-largest lawn care company with expected revenues of about $130 million in 1996. The company reported revenues of $95 million in 1995.

Hydro Lawn was founded 24 years ago by Jerry Faulring, one of the founders and the first president of the Professional Lawn Care Association of America (PLCAA). Faulring, who has been involved with a plant nursery the past several years, was unavailable for comment.

Barefoot president and CEO Patrick J. Norton says: “Hydro Lawn is another example of Barefoot acquiring a quality company to add to its portfolio of premier companies.” Hydro Lawn had revenues just under $4 million in 1995.

The acquisition adds to Barefoot’s customer base in the Washington, D.C. and Baltimore market areas. It reportedly has several other operations there. Barefoot has 53 company locations and 46 franchise locations, primarily in the central and eastern United States.

Hydro Lawn is just the latest of a string of lawn care operations to be absorbed by either industry giant TruGreen/ChemLawn (1995 revenues of $578 million) or Barefoot which is based in Worthington (Columbus), Ohio.

Bang! You’re disease-resistant

Herbicide-resistant bent was first; disease-resistant tall fescue could be next ‘shot from a gun,’ if Scotts researchers are on track.

by JERRY ROCHE / Editor-in-Chief

Using a “gene gun,” researchers at The Scotts Company believe they can produce brown patch-resistant tall fescue grass—soon.

“We think we’ll have a genetically-engineered tall fescue seed that is absolutely brown patch-resistant in the next year,” says Kevin Turner, manager of seed production and research at the Scotts facility in Gervais, Ore. “We believe we’ll be able to make it available [to buyers] within four years.”

The “gene gun,” invented by Dr. John Sanford of Sanford Scientific Inc., can deliver DNA into turfgrass and thus improve the turf's desirable characteristics. Scotts and Sanford Scientific signed a cooperative agreement earlier this year, which led Scotts to prepare a dedicated genetic engineering laboratory.

Genetic research will be conducted at the Dwight G. Scott Research Center in Marysville, Ohio. Initial work on the program was directed by Dr. Virgil Meier, but Dr. Lisa Lee will now assume its reins.

Dr. Lee and a Rutgers University research team used the gene gun to develop a bentgrass that is resistant to a widely-used weed control product, making it possible to selectively control most weeds without affecting the bent.

“We are extremely excited about using this technology,” says Dr. John Neal, who is Scotts’ vice president for research and development. “Employing genetic engineering will allow our researchers to add desirable traits as well as speed up the process of turfgrass variety development.”

Scotts estimates seven years to create and market a genetically-improved turfgrass, compared with 12 to 15 years without genetic engineering.
