Here are some close looks at Wright's spray equipment. His spray unit is made by the Minnesota-Wanner Company and is powered by a 9 h.p. Briggs Stratton engine. His pump is rated at 20 gpm at 1,000 psi. The lower pictures show what kind of spray pattern he gets from his broadcast tip. His jeep units are equipped to do either hand or boom work. The picture at right shows the value of a “front-view” mirror. From the driver's seat, Wright can watch the operation of the front-mounted boom, noting stoppages immediately. Without the mirror, Wright, said, it would be possible to travel quite a distance without knowing no herbicide was being applied.
When you see Elanco's weed-control crew lying around...

you know they're hard at work.

Elanco's pre-emergence herbicides offer advantages even the best man on your crew can't match. Finding a good man is tough enough. When you do, don't waste his expensive time—make the most profitable use of it. Let Elanco's crew take over the weed control.

Elanco's dependable herbicides control crabgrass and other annual weed grasses in turf areas. They also stop most annual weeds and grasses around trees, shrubs and flowers. Used as directed, they'll stop these weeds as they germinate, all season long.

You can release your men from jobs our chemicals can do better, longer, and for less cost. Free them for work that men can do and chemicals can't.

You'll get a high degree of safety. Plus economy. Plus convenience, with formulations to fit your equipment. You'll also get more satisfied customers, fewer call-backs.

See your distributor or contact Elanco for the name of one nearest you. Let Elanco herbicides lie around doing a job for you.

Preliminary rough grading of the Graeagle Meadows golf course greens and tees involved spreading fir bark four inches deep over a 14-inch layer of washed sand. The bark replaces peat.

The sand-bark process calls for rotovating the sand and bark to a two-to-one mixture for a depth of eight inches. The construction method was developed by landscape architect Ellis Van Gorder.

Graeagle Meadows, a recently completed 6,700-yard, 18-hole championship golf course in the heart of the Sierras in Graeagle, Calif., boasts a new method of tee and green construction.

Ellis Van Gorder, golf course architect, who designed the course, which averages 4,800 feet above sea level, calls the process "Sand and Bark" construction. The process is unique, he says, because fir bark "fines" are used in place of conventional peat.

According to Van Gorder, the process is faster and saves labor costs. The technique results in a more uniform surface, makes possible more even mixing of ingredients, and because of the product's excellent water retention value, results in more uniform seed germination. Because the bark is weed-free, the customary maintenance problem is almost completely eliminated.

Although Van Gorder has used the method before on such projects as Makaba Golf Course in Hawaii, and Peacock Gap Golf Course in San Rafael, Calif., he said the technique is not well-known.

"Primary shaping and contouring is done using existing soil," Van Gorder explained. "Normal care is given to promote proper drainage to avoid impounding water areas. Clean sharp sand is then laid on to a depth of 14" and rough-graded to the specifications of each putting surface. If an overabundance of silt is present, then washed sand would be desirable. A 4" layer of 3/8" fine fir bark is then spread over the entire putting surface. This is done with a conventional scraper and rough-graded again to the contour of the final green.

"The combination of bark and sand is then rotovated to a depth of 8" using extreme care to get a uniform mix. Each 4,500-square-foot green requires about 70 yards of bark. After rotovating, the surface is tractor-graded and rolled to final contour, then raked and dragged by hand to the final putting surface."

"Greens are then seeded 2½ pounds per thousand square feet, with a high-grade, weed-free seed mixed with a 10-10-10 combination of fertilizer (10 lbs. per thousand square feet) and 20 pounds of milorganite."

"The area is rolled again then kept moist during the entire germination process, from 14 to 21 days, depending on climate and atmosphere."

Van Gorder emphasized one advantage of fir bark at this stage. Because of the material's inherent water retention, he noted, bark is easier to keep moist, requiring fewer hours of watering. Because of the texture and bulk of the bark, compacting does not occur until well into the germination period. Although Graeagle has an ample and economical supply of water, this feature is particularly important in areas where water is expensive or in short supply.

Carl DellAquila, contour landscape grader, who has engineered such projects as the Palo Alto Muni Golf Course, Peacock Gap Country Club and Palo Alto Hills Golf Club, and the contour grader at Graeagle Meadows, cited some side ben-
golfing is accomplished with this equipment. The 18-hole championship golf course winds around a natural pine forest at an elevation of 4,800 feet.

Just prior to seeding, the greens and tees are hand-raked. Note the even texture and uniform pattern, a condition difficult to obtain with peat-type products.

fits on the sand-bark process. "One obvious benefit," he said, "is that we can tractor-grade the bark throughout the entire process. With peat, it's strictly 'by hand.' Peat bunches up under the blade and it's almost impossible to get a uniform texture unless you mix and fill completely by hand, through 'off site' mixing method. "This sand-bark method obviously saves time but it also gives a better surface with less raking and dragging by hand."

While bark used at Graeagle was obtained locally at the Feather River Lumber Company, in Loyalton, Calif., the company plans to market the product nationwide, in both bag and bulk quantities. It will be handled through the special products division of the R. F. Nikkel Lumber Company, Sacramento, Calif. Nikkel also plans to market a line of bagged "decorative" fir bark products for sale through retail outlets and nurseries.

THE ONE FOR MANY JOBS...

One machine can shred and screen soil for your golf course. Turn sewage sludge cake into a useable fertilizer and soil conditioner. Prepare and maintain growth materials for your greenhouse, conservatory, or gardens. Help build and maintain safe recreation and athletic areas . . . with fields and tracks of shredded and screened materials.

One machine can help you with all these needs when it is a Lindig Shredder/Screener. Exclusive Lindig hi-speed hammer-mill shredding delivers processed materials of unequaled quality at lowest cost. And only Lindig offers a Screener Attachment that mounts directly onto the shredder. It's one full mobile unit, requiring no extra power unit or support frame for screening.

A new variety of Colonial Bentgrass reported to be as easily managed as bluegrasses is being introduced for golf course use by Northrup, King & Co.

Called HOLFIOR Bentgrass, the new variety has been undergoing tests by Northrup King since 1956 and is said to produce a turf of uniform color and texture over the entire fairway. It is recommended also for use on aprons and tees, but not on greens.

According to Howard Kaerwer, chief turf agronomist at Northrup King, HOLFIOR produces plants of leafy, dense and upright growth that do not segregate for color, texture, leaf width or growth characteristics. Golfers reportedly like the firm, upright support it gives the ball.

HOLFIOR thrives with only the moderate amounts of fertilization and irrigation required by bluegrasses. Intensive disease control measures are needed infrequently; it is resistant to snow mold and only moderately susceptible to Dollar's spot.

Said to be the fastest-establishing bentgrass available, HOLFIOR also mows clean without matting or tufting. It can be mowed at any height from 1/4" to 1 1/4".

HOLFIOR adapts well to varying conditions of soil and moisture, and is compatible with the new short-cut bluegrasses (Prato, Fylking, Pennstar). For more details, circle (713) on reply card.

A purchaser of cultivated sod should get an "owner's manual."

Let's think about it.

Suppose you bought an automobile, tractor, or major appliance and weren't provided an owner's manual covering maintenance and operating instructions. The first time something went wrong and you didn't know why or didn't know what to do, who would you blame? The manufacturer, of course.

Isn't it possible that the reaction may be the same when the product is sod? How many times have you had to replace sod when you knew your product wasn't at fault?

Turf specialists know that it's as easy to burn up a lawn as it is to burn up an engine; that a lawn can become as "sluggish" through improper fertilization, watering and mowing, through weed infestation or disease as can an engine without proper maintenance.

Most cultivated sod is near perfect upon delivery. It just makes sense that the longer the sod remains fairway, the longer the customer is going to be satisfied with the product. So wouldn't it be good business to tell the purchaser of your product how to keep it in "showroom" shape?

You know better than anyone else how to take care of that sod you grew. Most recommendations on turf care are necessarily general. Since sod is usually marketed within a 100-mile radius of where it is grown, you can provide the most precise information on how to care for it.

Where would you begin? Well, as a homeowner, here's what I would like to know:

1. Soil Preparation. What steps should be taken to prepare the ground for receiving the sod? Should I attempt to eliminate weeds, cultivate, fertilize?

2. Breaking-In Instructions. Exactly how should I water the new sod? When should I first mow it?

If you are a Sod Grower you should be a member of ASPA.

Keep in touch with progress.

Allied Industries are welcome.
Try These Tips on Using Dicamba and Mecoprop

Broadleaf weeds in turf ought to be as archaic as the Model T Ford, exclaimed Dr. Edward W. Stroube at the recent Ohio Turfgrass Conference.

Good turf management practices should all but eliminate weeds, said the Ohio State agronomist, but should some appear, there's a herbicide to quickly take care of the culprit. Uniform and timely applications are necessary, however.

"Most weeds are more susceptible when there is good soil moisture and when the weeds are growing rapidly," he said. "They become more resistant when they become semidormant due to dry soil or as they approach maturity."

Herbicides recommended for broadleaf weed control are intended for turf areas only, Dr. Stroube reminded. Indiscriminate use can bring injury to flowers, trees, ornamentals and gardens. He advised that, if sprayed, the compounds should be applied at low pressure and during periods of little or no wind.

"Dicamba (Banvel) should not be used under desirable plantings, as root absorption by these plants may result in injury," he warned.

Herbicides should not be used on newly seeded turf unless weeds pose a greater danger, Dr. Stroube said. It has been reported, he added, that the relatively new herbicide, bromoxynil, is safe to use on seedling broadleaf weeds in newly established turf.

For states with climate similar to Ohio's, Dr. Stroube offers his recommendations in Table 1 for controlling some of the more common weeds that appear in turf.

Lee Record, agronomist for the United States Golf Association offered advice on using the systemic herbicides, Dicamba and Mecoprop (MCP). The two will effectively control knotweed, clover, common chickweed and mouse ear chickweed. Formulated with 2,4-D, they will control dandelion, plantain and pigweed.

Systemic herbicides make use of physiological differences of plants for selectivity, Record explained. Dicamba and Mecoprop applied to leaves penetrate the cuticle and stomata, translocating to the food or water conducting tissue and then to other parts of the plant.

Pattern of translocation is influenced by the kind and stage and growth of the plant, Record said.

"Sometimes, the herbicide is absorbed and inactivated by cells in the leaf," he said, "and sometimes it may remain on the leaf surface and never enter the plant."

Soil relationships to the herbicide, temperature and moisture have been

"The Pioneer in Foliar Feeding"
Honored by American Horticultural Council "for demonstrating in a practical way that plants could be fertilized through their leaves; for being the first to develop and market an effective plant food for foliar feeding; and for opening the way to a new cultural practice in horticulture."
recognized as important factors in the effectiveness of weed control programs, he said.

"Optimum conditions for weed control when using Dicamba and Mecoprop would be to have adequate soil moisture and temperatures between 70 and 75 degrees.

"We have seen on numerous occasions the importance of having adequate water as a carrier for Dicamba or Mecoprop. One-half to three-quarters pound of actual material applied in 40 to 50 gallons of water per acre will give excellent results.

"The same rate of actual material in 20 gallons of water per acre will give very poor results.

"We have found that Dicamba and Mecoprop have a wide margin of safety when used intelligently. Repeated applications from year to year, on the other hand, have shown thinning of bentgrass and bluegrass. Complete kill has been noted on turf when herbicides were misused."

**World Pesticide Symposium**

**Set at MSU for Feb. 25-27**

Six hundred of the world's top researchers will convene for a pesticide symposium and the dedication of Michigan State University's Pesticide Research Center, Feb. 25-27, at East Lansing.

Speakers and topics have been confirmed for the "Symposium on Pesticides in Soil: Ecology, Degradation and Movement," according to Dr. Gordon E. Guyer, chairman of MSU's entomology department and director of the Pesticide Research Center.

The symposium will be keynoted by J. Van der Drift, soil biologist from the Netherlands and summarized by Dr. L. J. Audus of the University of London.

Presenting research papers during the meeting will be scientists from Germany, Canada, England and the United States.

A tour of MSU's new Pesticide Research Center will be conducted Thursday afternoon, Feb. 26, and the center will be officially dedicated that evening.

"The symposium is built around this interdisciplinary approach to research," said Dr. Guyer. "Scientists will report on the effects of pesticides on our environment and the latest efforts to reduce pesticide residues."

**Central Chemical Forms**

**Turf Products Division**

Central Chemical Corporation, Hagerstown, Md., has formed a turf products division.

President Franklin M. Thomas, Jr., said the new division's purpose will be to serve the turfgrass industry with selected fertilizers, chemicals and specialties.

George Cassel has been named division manager. Headquarters will be at Central Chemical's Everett, Pa., offices. Cassel, a Penn State graduate, is a 19-year employee in the company's agricultural group.

James M. Edgar, who has been associated with the golf industry, has been hired as the division's first sales specialist.
Florida, Michigan Leading
In Golf Course Construction

With the picture ever-changing, there were at year’s end 439 golf facilities under construction throughout the country, reports Harry Eckhoff, facility development consultant for the National Golf Foundation.

Eckhoff authored the golf industry outlook for the coming year in the December issue.

Of the new facilities, Eckhoff reported, 381 are regulation courses and 58 are par threes and executive type.

States leading in new golf course construction are: Florida, 30; Michigan, 25; Illinois and Pennsylvania, each 21; California and Ohio, each 20; North Carolina, 19; Tennessee and Texas, each 18; Virginia, 16; New York, 15; Washington and Indiana, each 14; and Georgia, 12.

Prolonged tight money has brought some changes into financing of golf projects, said Eckhoff. “Many private clubs are selling long-term interest-bearing bonds to their members,” he said. “Small syndicates are being created to finance profit-motive golf courses. Some projects are obtaining legal authority to sell stocks on the open market.”

An example of the stock venture, Eckhoff reported, is the 18-hole Trent Jones designed Golden Triangle Golf Course planned for the 170-acre Johns Hopkins Estate between Baltimore, Md., and Washington, D.C.

Stock offering for this one is under way, according to Carl Rasnic, former PGA Middle Atlantic Section president and now president of Golden Triangle.

A stock offering of four million shares, Eckhoff said, has been announced by American Family Recreation Centers, Inc., of Annapolis. Proceeds will be used to build year-round resorts, including golf courses, motels, travel-trailer parks, swimming pools and other facilities. They’ll be located between Kentucky and Florida adjacent to Interstate 75 and from Virginia to Florida adjacent to Interstate 95.

The first two resort sites, Eckhoff continued, are planned (each at a cost of about $8 million) just south of Atlanta and in the Orlando, Fla., area.

Insect Report

WTT’s compilation of insect problems occurring in turfgrasses, trees, and ornamentals throughout the country.

TURF INSECTS

CHINCH BUG
(Blissus leucopterus)
INDIANA: Noneconomic in 23 grass and soil samples in northwest, west-central, northeast, and east-central districts. Averaged 24 per square foot at one location each of Atkinson in Benton County.

GRASS WEBWORM
(Herpetogramma licarsialis)
HAWAII: Heavy on turf in park at Mililani, Oahu; larvae and/or pupae 10-12 per square foot.

INSECTS OF ORNAMENTALS

ARMORED SCALES

FLORIDA: Nymphs and adults of Lepidosaphes maskelli on 90 percent of 939 Juniperus chinensis in nursery at Dover, Hillsborough County. All instars of Pseudomida clavigera on 100 camellia plants in nursery at Englewood, Charlotte County.
RESPONSIBLE weed scientists can no longer afford to remain silent when some of the "popular ecologists and environmental opportunists" issue "exaggerated or politically motivated claims" about pesticides.

Homer LeBaron of Geigy Agricultural Chemicals Corporation issued this warning and challenge as he opened the 24th annual meeting of the Northeastern Weed Control Conference, Jan. 7-9 in New York City.

Considering how the decisions were made banning the uses of DDT and cyclamates, "politics and emotion, rather than scientific evaluation of data, could control the destiny of a pesticide," he told some 600 weed scientists.

In the more recent attack on 2,4,5-T, he continued, it is impossible to tell which attackers are concerned with environmental quality and which are against the Vietnam war.

Elimination of environmental pollution is one of the announced major commitments of the government for the next decade, LeBaron reminded.

"Most of us in weed science have been motivated by the potential in this field to benefit mankind, to alleviate hunger, to improve the environment. One of our great challenges for the 1970s will be to use herbicides more in the prevention or reduction of environmental pollution, in environmental beautification, and in conservation of crops, land, labor, and natural resources.

"We are entitled to be proud of our accomplishments."

Recent developments indicate, however, that a credibility gap has opened and that our activities are grossly misunderstood by the general public, LeBaron said.

We have always been aware of the hazards from the misuse of chemicals, he continued. "We have always been in favor of proper balance of the three Rs, Research, Reason and Regulations."

"It is clear that we will be more preoccupied in the next decade with four Ps: Pesticides, Pollution, Politics and Public Relations.

"One of our major goals for the 70s must be to more effectively communicate the importance, safety, and potential of herbicides to mankind."

Delaney Clause Ought to Go

LeBaron, the outgoing president of the northeastern group, called for an end of the "Delaney clause" in government pesticide regulations, which, he said, had become as impossible to live with as the "no residue" tolerance clause just recently changed.

The Delaney clause states that no food additive shall be deemed safe if it is found to induce cancer when ingested by man or animal.

A more workable safeguard is needed, said LeBaron, because "so many relatively safe compounds can
