Cut Out
Weed Cutting
For one or more years

Why let weeds make a hazardous, unsightly takeover of your operation? And why waste time mowing, hoeing, pulling or griping? Oxy Ureabor puts weeds out of sight, out of mind, for one or more years. In most cases, at high rates, no weed or seedling is tolerant of Ureabor. And it’s so easy to apply direct, from convenient-size bags.

- Kills perennials and annuals in one application.
- Long-lasting control of seedlings and regrowth.
- Ready to apply straight from the bag.
- Water soluble—readily absorbed after rainfall or sprinkling.
- Quick action—down to the root zone.
- 98% active ingredients (1 to 3 lbs. per 100 sq. ft.)

Circle 137 on free information card JANUARY 1977/WEEDS TREES & TURF
As with many insects, the immature or larval stage of an insect is the most damaging. This is particularly true in the case of butterflies and moths, where the larval stage causes damage and the adult beautifies the surroundings with its presence. One particular group of moth larvae, the cutworms, cause problems and sometimes severe damage to crops, vegetable plants, and turf.

Cutworms are a serious pest in the south on grasses on the home lawn as well as the golf course. They produce multiple generations each year and can be a problem from the time the weather warms up until it frosts in the fall.

The abundance of a given species of cutworms is greatly affected from year to year by rainfall conditions which may prevent the adult moths from laying their eggs or by flooding which will force the larvae to the surface where they become food for birds or other predatory insects or animals.

The cutworm overwinters in the larval or pupal stage although a few hibernate as adults in the soil or under trash or in clumps of grass. The larval stage burrows into the soil beneath the turf and comes out to feed at night. This cutworm is cosmopolitan and has a pernicious habit of cutting off several plants while satisfying its appetite.

Their eggs are laid singly and occasionally two or three together on the blades and stems of the turf. The larva is a greasy gray to dark

**Notes:**
- Plots — 90 sq. ft. each
- Counts — each represents a total of 2 — 1 sq. ft. areas
- Counts made with use of Diagnostic aid 8/18/76
- Plots were treated with 1.5 gallons water, applied by hand — one application
Exhalt 4-10, the Winter Coat.

It's only a thin film. But it wraps your plants up safely for the Winter. They can "breathe," but without excessive transpiration. Transplanting can be extended with fewer plant losses. And "browning off" of new or established evergreens is prevented.

Easy and Economical

One part of 4-10; four parts of water. Spray until run-off occurs. That's all there is to it. And since Exhalt 4-10 stays in suspension without agitation, you save time and labor costs.

Not Damaged by Freezing in Storage.

Exhalt 4-10 does not separate when frozen. Store it away for the Winter — it'll be ready to use when you need it. One spraying does it for the Season. The coat stays on, until new growth begins.

Exhalt® 4-10
Anti-Transpirant for plants and turf.

Crop Protection Division, Kay-Fries Chemicals, Inc., Stony Point, N.Y. 10980

brown and occasionally black color with faint stripes.

The black cutworm takes advantage of the cultural practice of aeration of golf greens. A course may not have a bad cutworm infestation, but as soon as the greens are aerated in come the cutworms. These little aeration holes or pockets make an ideal hideout for this bandit to move in and out of as he devours the turf.

Severe feeding causes areas to turn brown and occasionally die out. The feeding patterns radiates out from a hiding place. As the food source decreases around one hiding place the larvae simply moves to a more lush area.

Control of the cutworm has been established by several materials on the market: Dursban, Dursban Plus, Diazinon, Proxol, Dylox and Sevin. In addition to these, new materials coming on the market show good cutworm control potential.

These tests were made on bent green varieties Seaside and Emerald at the turf plots on the Simpson Experiment Station in Clemson. A single application was made by had to each 90 square foot plot on Aug. 18, using a 1.5 gallon sprinkler can. The pre and post treatment counts were made on two one-square foot areas in each plot using Diagnostic Aid as an adjuvant to stimulate larval movement.

All the registered materials in the test showed excellent control. The Dursban and Proxol treatments agitated the larva within 15 minutes after application as they were noted squirming on the surface. Orthene 75S and U.C. 51762-75WP showed good and consistent control of the larvae. The Velsicol materials Vel-4283-4EC and Vel-3883-90WP were a little erratic but did give good control. In no instance did any of the materials cause any phytotoxic symptoms on the plots.

Between the materials on the market and the new materials coming, cutworm control as well as other turf pest, should be no problem on the golf course or in the yard providing the applicator uses the materials properly.

D. K. Pollet is an assistant professor of entomology with Clemson University College of Agricultural Sciences.
Good things come in small packages.

Whether you purchase seedlings for permanent planting or prefer to grow your own stock for later transplanting, you'll be impressed with our wide variety of fir, pine and spruce seedlings. Northern-grown for hardiness, they've all been personally cared for by the owner to assure that you receive only the very best.

As a businessman, you'll appreciate our dependability almost as much as our reasonable prices.

Agricultural scientists in the past reported substantial volatilization losses of nitrogen from surface-applied urea. But 1976 studies conducted by Dr. David E. Kissel of Texas A&M University, utilizing a new collection device he designed, indicate some former test conclusions may be wrong.

Experiments carried out by Dr. Kissel in 1974 and 1975, using traditional methods, confirmed earlier nitrogen volatilization loss data. Dr. Kissel, however, was not satisfied that measuring techniques were appropriate for natural field conditions. In fact, he noted that the traditional measuring equipment actually created an artificially adverse environment that greatly induced nitrogen volatilization readings.

During the winter of 1975, Dr. Kissel, working closely with Texas A&M and U.S. Department of Agriculture engineers, developed an accurate new collection device that would not create conditions of artificial temperature, relative humidity and soil water content. He believed these conditions were responsible for limiting reliability of previous data.

Then in 1976, he conducted a series of experiments on coastal bermudagrass sod using his new measuring device, which did indeed confirm his opinion that some earlier volatilization data had been incorrect.

At application rates ranging from 50 to 400 pounds of actual nitrogen per acre, Dr. Kissel was unable to measure greater than a 3 percent loss of nitrogen from any treatment, and that occurred only at the 50-pound per acre application level. Losses of only one, 0.5 and one percent respectively, were measured at the 100, 200 and 400 pound application rate levels. Calcium nitrate, dry urea, uranium nitrate solution spray and uranium applied in narrow bands on the soil surface were tested. Dr. Kissel said the average of test results for two seasons indicated nitrogen uptake by the crop was "close to the same for all N sources."

"Because this conflicted with the previous data," Dr. Kissel explained, "we then recreated the experiment in the laboratory using former equipment, and found that our volatilization losses ranged as high as 39 percent."
Q: Why should you see the new C?

A: Because seeing is believing! For years the Ditch Witch Model C has been the best compact trencher made. And now, it's even better. We've improved it so that it's even more efficient and easier to use. It's still the best small trencher made, and we'd like for you to see why. Charles Machine Works, Inc., P.O. HOW TO
TOP DRESS 18 GREENS FAST.

It's simple to do. Just place the top dresser attachment on the back of your 18 hp Turf Truckster chassis with the optional PTO, insert two pins, connect the sprocket drive chain to the PTO, and you're ready to work.

You save money as well as time. The Cushman top dresser eliminates the need for expensive, slow-moving, self-powered units. You use an existing power source to economically and quickly spread a variety of materials.

Your operator moves rapidly from green to green, with no time-consuming walking or laborious loading and unloading of extra equipment. He merely sets the metering gate and the engine/ground speed governor for an exact spread thickness. The moving belt and brush dispense materials uniformly in a smooth 3½-inch swath.

USE YOUR CUSHMAN.

And now we've added improvements that make the top dresser even better. The unit mounts directly on the chassis, without an extra frame. And the new system uses a rubber fabric conveyor belt to carry material to the gate. It's quieter, with reduced maintenance and longer life than the previous design. Plus, it enables you to spread materials from rock salt for icy sidewalks to fine, powderized soil on greens or tees.

Like all Cushman equipment, the top dresser and Turf-Truckster are built to last. So you get an efficient system that will handle just about any spreading job for years to come. With other accessories, your Cushman can spray, spike, aerate, and dump. Use it. It's more than basic transportation. It's a total turf-care system.

Write for your Cushman Turf catalog today.

Gary Holland has been named general manager of the Whirl Trim division of The Toro Co. He will be headquartered in Eden Prairie, Minn. Holland graduated from the University of Missouri as a mechanical engineer. He also holds an M.B.A. from Purdue University.

Doyle C. Jones has been elected president of the Florida Turfgrass Association. A landscape superintendent at Walt Disney World, Jones has served as director, secretary-treasurer and vice president.

Randy F. James has joined the Chemagro agricultural division of Mobay Chemical Corp. as a sales representative. He received a B.S. from the University of South Dakota.

Joseph Gent has been promoted to branch manager of the Minneapolis distribution center of the Thompson-Hayward Chemical Co. In his new position, Gent will be responsible for the sale and administration of the company’s line of agricultural, industrial and textile supplies.

Thomas W. Dlugos has been promoted to northern regional sales manager of the agricultural business group of Velsicol Chemical Corp. He received his B.S. in biology/conservation from Wisconsin State University.

Ronald S. Leafblad has been named president and general manager of Ag-Chem Equipment Co., Inc. Leafblad's experience includes his most recent position with Toro as group vice-president-outdoor equipment group. Previously he served as division president and vice president of marketing for White Motor Corp.

Joining the agricultural division of Ciba-Geigy Corp. as field sales representative in northwest Missouri is Dennis Gray. Gray was a district sales manager with Columbiana Seed Co. He holds a B.S. in agricultural mechanization from the University of Missouri.

John Stark has been appointed marketing manager of the outdoor power equipment division of J I Case Co. Stark, who attended the University of Wisconsin, was formerly a materials manager for that division.

Gary Custis, Dick Evenson and Gregg Deegan have been named technical representatives for the ProTurf division of O. M. Scott and Sons. Custis recently earned a master’s in agronomy from Virginia Polytechnic Institute and State University. Evenson comes to ProTurf after 25 years in the Air Force. A member of the Air Force Golf Course Council, he most recently supervised the golf course at Dover AFB, Del. Deegan is a former golf course superintendent.

Bob Miller has joined Lakeshore Equipment & Supply Co. as eastern manager for the company’s LESCO line. A Clemson University graduate, Miller is a specialist in agronomic fertilizer and turfgrass management.

Robert DeCicco has been promoted to marketing manager for the agricultural chemical division of Thompson-Hayward Chemical Co. In his new capacity, DeCicco will plan and coordinate the overall marketing plan for proprietary agricultural chemicals.

Diamond Shamrock Corp. has named Charles E. Osgood as commercial development technical representative for the northwest territory. Osgood will be responsible for coordinating university, state and inhouse field development activities for the company’s agricultural chemical products in the northwest. He holds a B.S. in Entomology from the University of Maryland and is working toward a master’s in entomology at Oregon State University.
