How Roundup® helped Jim Siegfried renovate this fairway in days, without closing it for one minute.

Last fall, Jim Siegfried found a way to clean it up, without tearing it up—at the height of his club's busy season. With Roundup® herbicide by Monsanto.

Jim is the Greens Superintendent at Losantiville Country Club, Cincinnati, where bermudagrass had become a serious problem on the 18th fairway. To control it, Jim applied Roundup once—while the weeds were still actively growing—right at the start of the Labor Day weekend.

"That's really 'prime time' here," Jim told us. "But after we applied Roundup, we kept the fairway in play the whole weekend, and after. The members played right over it, with no problem.'

Since Roundup has no residual soil activity, and won't wash or leach out of treated areas to injure desirable plants, Jim simply took normal precautions against spray drift—and didn't worry about damaging desirable vegetation along the fairway.

Even better, he was able to re-seed right into the dying bermudagrass only 7 days after applying Roundup—without loss of playing time or inconvenience to the membership.

Reinfestation won't be a big problem for Jim, either. He knows that Roundup destroyed the rhizomes of the treated weeds, helping prevent their regrowth.

Jim thinks he'll use Roundup again this year—and apparently some club members hope so, too. "As soon as they saw how good this fairway looks, some of the members started asking when I'm going to do the same for #10, where we have some more bermuda. I'll probably tackle that with Roundup this fall.'

If controlling many tough emerged weeds and grasses is a problem for you, see your local Monsanto representative or chemical dealer soon for your supply of Roundup.

Roundup. It worked for Jim Siegfried. It can work for you.

SEVIN® WORKS WHILE PEOPLE PLAY.

That's why SEVIN® carbaryl insecticide is the answer to your professional grounds maintenance needs.

Versatile, broadly registered SEVIN controls as many as 44 insects that attack trees, shrubs, flowers, turf...and people. And it has a long record of effective control of target pests.

Environmental concern?

That's another good reason to use SEVIN, since it is biodegradable, and has no objectionable odor. When compared to other commonly used insecticides, it ranks low in toxicity to people, farm animals, birds and fish.

It offers other benefits too. SEVIN is compatible with many commonly used fungicides, miticides and other insecticides. Choose from several formulations to best fit your specific needs.

People. Pests. Professional grounds maintenance. SEVIN carbaryl insecticide. They all go together.

For more information about SEVIN, contact your pesticide supplier or Union Carbide. Find out first hand why SEVIN is one of the world's leading insecticides.

Another Triumph of quality and performance

What makes Triumph an even greater Triumph?

Just this: any of our mowers is easily mounted to more than 275 different tractors and loaders — for a perfect fit!

Every heavy-duty highway mower that Triumph makes represents the ultimate in design, craftsmanship and rugged durability... and there's a model to meet your specific need. An economical Utility Mower. Our Hydro-Clippers with automatic self-returning breakaway. A unique extension mower. Our famed rotary model, the Roto-Flex "50". Every one boasts all-hydraulic drive — no chains, belts, cables or clutches — for flawless performance every time!

For details about the complete Triumph line and for your FREE copy of our "Mower Tips" booklet, write or call Triumph today.

Poa Annua from page 50

pathogenicity have been based on observations from the field of the association of Colletotrichum graminicola with dead and dying annual bluegrass. In other words, the pathogenicity of Colletotrichum graminicola on annual bluegrass has yet to be shown by the widely accepted laboratory procedure of isolation of the fungus, inoculation of plants, observation of symptoms, and then re-isolation of the fungus. All of what we feel that we know about anthracnose on turfgrass in general, and on annual bluegrass in particular, then, has been gained through apocryphal statements, field observations, and interpolations from research conducted on the disease as it occurs in cereal crops. Furthermore, a systematic field study has never been conducted to determine the exact distribution of Colletotrichum graminicola within the annual bluegrass growing region of the North American continent. This means that not only are we lacking in substantive knowledge of the pathogenicity of anthracnose and its potential for killing out stands of annual bluegrass, but, also, we do not know whether the fungus Colletotrichum graminicola actually exists in a high percentage of the areas in which the summer dying-out of annual bluegrass occurs.

Is it Anthracnose or is it Wilt?

We now come to the bottom line. The question is, when annual bluegrass dies during warm, humid weather, is the cause of this death anthracnose, wilt, or a number of interacting factors? Furthermore, if these stress factors are lethal, are they necessarily the same from one area to the next, or from one warm season the next?

The lethal effects of high temperatures on annual bluegrass are well documented. When compared with the more commonly
Poa annua
grown temperate zone grasses, its heat hardiness ranks among the poorest. Depending on the range and duration of the day-night air temperature patterns, the progress of the deterioration of the plant may be either rapid or slow. In the final analysis, however, the fact remains that even with the more heat tolerant strains, heat stress alone is capable of either killing annual bluegrass outright or significantly reducing its capacity to compete successfully for the same growing space with the other temperate zone grasses. Furthermore, while it is more tolerant than certain other temperate zone grasses to some of the other environmental stresses, when compared to them with respect to its capacity to survive the collective and continuing pressures of these various stresses, annual bluegrass has the poorest potential for survival.

Our working knowledge of the nature of anthracnose on annual bluegrass, on the other hand, is very limited. In addition to the lack of information on its pathology, we do not know whether the disease actually occurs in all of the areas of the North American continent characterized by the summer drying-out of annual bluegrass. If this were actually to be the case, it would indeed be a very unique circumstance, for it would be the only disease of turfgrasses that is of major importance uniformly throughout this total area.

The capacity of annual bluegrass to withstand periods of drought is less than any of the other temperate zone grasses.

Also, it would be the only turfgrass disease that is both epidemic and severe in its outbreak each year. The likelihood of this being the case for anthracnose is extremely remote.

Based on what we know about both the nature of annual bluegrass and the various disease and environmental stress factors that attend its growth, it is both simplistic and
Poa annua

highly unrealistic to try to designate any one of these as the universal and continuing cause of its death during warm weather. However, as we look to these various factors, certain of them can be ranked as more significant in their impact on the longevity of annual bluegrass than others. In reviewing the research information we now have, there is not sufficient data to establish anthracnose as a major factor, contributing in its own right either the widespread or local dying-out of stands of annual bluegrass. On the other hand, with the knowledge we have of the relative susceptibility of annual bluegrass to heat stress, it would seem reasonable to assume that of all the stress factors, on a year-to-year basis, high temperature is probably the most frequent, if not the most important, single cause of the death of annual bluegrass during the summer season.

Not only are we lacking in substantive knowledge of the pathogenicity of anthracnose to annual bluegrass, we do not know if it exists in significant numbers in areas where dying-out occurs.

Finally, An Aid For Teaching Turfgrass

Superintendents, Contractors, Lawn Care Managers, New, On-the-Job Reference. The Turf Managers' Handbook is a comprehensive, organized approach to turfgrass science and care. It has been designed and written by leading turf specialists from Purdue, Dr. William Daniel and Dr. Ray Freeborg, for on-the-job reference and as a text for students.

The book contains 150 illustrations and 96 color photographs. Data includes 240 tables and forms. Included are specifications for rootzones, employment, calculations for chemical applications, and extensive metric-imperial conversion. Business and technical aspects of turfgrass management are covered in this 424-page Planning, purchasing, hiring, construction, and plant selection are put together for easy on-the-job reference. Markets covered include lawn care, sod production, golf course management, cemeteries, athletic fields, and low maintenance areas. If it concerns turf, it's in the Turf Managers' Handbook.

Ordering Information

Please send ______ copies of the hardback ($18.95 ea.) ______ copies of the paperback ($14.95 ea.)

A shipping charge of $1.25 per book must be added. A check or money order for ______ is enclosed. Please charge to my VISA or MASTER CHARGE (circle one) account no. _______, expiration date _______.

I understand that delivery may take six to eight weeks. Quantity and bookstore rates available upon request.
EXPANSION

Company announces lawn care division

Environmental Landscape Services, Inc. has formed a chemical lawn care division, said Charles R. Racusin, president of the Houston-based firm.

The new division will offer residential lawn care services that will include fertilizing, weed and insect control, and fungicide application.

Gary Koerner, has been named to head up the new division. Koerner previously worked with the R.W. Collins Co., the largest lawn care company in Florida.

TREES

Cure for Dutch elm found by accident

A University of Chicago medical student says he might have stumbled across a solution to Dutch elm disease while attempting to discover a cure for cancer.

William J. Elliott was studying ways of synthesizing maytansine, a potent anticancer drug, when he learned a chemical analog of that drug attracts beetles that cause Dutch elm disease in elm trees.

An analog is a man-made equivalent of a natural chemical.

Mr. Elliott and his colleagues say they have developed a method to produce the analog, multistriatin, and that the raw materials are "cheaper to buy than gasoline."

Mr. Elliott says a vial of the chemical is placed at the base of a tree and the beetles get entangled in fly paper when they venture near the attractive chemical.

Josef Fried, the professor directing the research, says enough multistriatin has been produced to attract all the elm tree beetles in North America.

MANAGEMENT

New officers to serve Natl. Landscape Assoc.

The National Landscape Association recently elected officers to serve the organization through 1980.

Frank N. Tomlinson, Tomlinson's Select Nurseries, Calif., was elected president; Gerald Harrell, Landscapes Unlimited, Texas, was named vice-president; and Joe Wayman, Forrest Keeling Nursery, Mo., was selected secretary-treasurer.

Directors re-elected to another term included Denny R. Church, D.R. Church Landscape Co., Ill. and Robert Siebenthaler, The Siebenthaler Co., Ohio. Former president Dale Manbeck, Manbeck Nurseries, Ohio, was named director-at-large and Richard Campbell, Campbell's Nursery and Garden Center, Neb., was selected to fill a vacant seat on the Board of Directors. The seat was vacated when Donald Johnson, Johnson's Nursery & Garden Center, S.D., retired.

TURF SEED

Fast-growing seed gains accreditation

Sable Poa trivialis has been granted a certificate (PV 7700104) under the Plant Variety Protection Act by the Plant Variety Protection Office of the Department of Agriculture, according to J.L. Carnes, president of International Seeds, Inc., Halsey, Ore.

Sable was developed cooperatively by I.S.I. and the New Jersey Agricultural Experiment Station at Rutgers University and is the first domestic variety of Poa trivialis granted such a certificate.

Known for its ability to endure shade, Sable has also performed well in the winterseeding of fine turf, particularly golf greens, in the southern U.S.

Prior to Sable, the only Poa trivialis available to fine turf managers was common, unpedigreed seed imported from northern Europe which often contained undesirable weed seeds such as Poa annua.

A rigid certification program in Oregon produces Sabre seed of exceptionally high quality.

A rapid germinating variety, Sabre mixes well with the various fine-bladed ryegrasses, fine fescue, and bluegrass.

CHEMICALS

Granular linuron helps control Poa annua

The Poa annua problem in Ken-tyucky bluegrass sod fields and golf courses of the northern U.S. may have met its match from granular linuron, according to a recent speech by Paul L. Jacquemin, of O.M. Scott & Sons.

In a presentation to the Kentucky, Ohio, and Iowa Turfgrass Conferences, Jacquemin announced the results of an eight-year, 20-state test program to control Poa annua. The tests involved the wide range of soil composition, seasonal temperature effects, application timing, and alternative before-and-after maintenance practices such as fertilizing and watering.

Jacquemin's address includes a description of the Poa annua problem, tests performed, a summary of the results, and detailed guidelines for use of granular linuron.

The full text of his speech, titled "A New Concept for Poa annua Control in Bluegrass Turf", is available by writing to Bill Boyd, O.M. Scott & Sons, Marysville, Ohio 43040.

SOD

Blue grama grass cultivated from sod

A USDA range scientist has found that sodding with blue grama grass can help areas that need erosion control and lands disturbed by mining or construction.

William McGinnies of the Science and Education Administration-Agricultural Research in Fort Collins, Colo., studied blue grama for its use on the Central Plains. A native grass, blue grama is highly palatable and nutritious but difficult to establish from seed.

Successful sodding of blue grama requires that soil be moist or wet when it is removed; it be done during periods of active growth (May and June); and sod be irrigated in its new location. Establishing the grass depends on development of new adventitious roots which come from new tillers.

Irrigating transplanted sod three times with one inch or less of water resulted in twice as many new roots as sod irrigated only once. Three irrigations also increased rate of root growth.
DURSBAN 2E is the one insecticide that works. DURSBAN* 2E Insecticide is ideal for broad spectrum, multi-purpose insect control everywhere around the club. Outside, DURSBAN 2E gives you unsurpassed control of turf pests like chinch bugs, sod webworms and cutworms, plus ticks, chiggers and mosquitoes. It even wipes out bagworms and many other ornamental plant pests. Inside, it cleans up the toughest roach problems, and keeps working to rid your buildings and restaurant areas of insect pests. Ask your supplier about the one insecticide that really works, DURSBAN 2E. Just be sure to follow all the directions and precautions on the label. Agricultural Products Department, Midland, Michigan 48640.
Ohio nurserymen award research grant

The Ohio Nurserymen's Assoc. (ONA) recently presented a $5,500 research grant to Drs. Charles Gilliam, Thomas Fretz, and Elton Smith of the Department of Horticulture at Ohio State Univ. for research into the container production of Taxus.

During the past several years there has been increased interest in container production of Taxus. This shift in the production techniques of Taxus is occurring without adequate research. This project will initiate a five-year study to identify the cultural characteristics necessary to successfully produce container-grown Taxus.

The potential advantages of Taxus production in containers are many and include: (1) a reduction in time of production, (2) increased uniformity of the finished product, (3) a reduction in winter desiccation, (4) reduced labor costs of digging and marketing, (5) a greater ease of managing cultural practices such as irrigation, fertilization, pruning, and pest control.

A number of problems are already associated with the practice of growing Taxus in containers: toxicities and deficiencies of minor elements, macro-nutrient deficiencies, light requirement needs, and poor root growth.

Objectives of this five-year project are:

1. An investigation into the relationship between rates of nitrogen fertilizer, shading, and media on growth of Taxus.
2. Establishment of deficiency and toxicity ranges of boron, copper, iron, manganese, and zinc as an aid in leaf analysis programs.
3. An investigation of various means of accelerating growth of Taxus liners in containers immediately after propagation.
4. An investigation of specific periods of nutrient uptake in Taxus and to determine if fertilizer applications can be timed for more effective utilization.
5. A comparison of container- and field-grown Taxus for adaptability and survival rates in the landscape.

The $5,500 grant marks the first substantial commitment to nursery industry research made by the 500 member Ohio Nurserymen's Assoc. It is the hope of the ONA that annual grants of similar amounts can be made to deserving research projects.

The ONA will share all research findings with the national nursery industry as results become available.

The days when turf just laid around looking pretty are long gone. Now your turf has to be pretty—and pretty tough, too. Tough enough to take all kinds of wear and still go on looking terrific.

That's just why so many pros like you specify turf seed from Northrup King. For years, Northrup King has given pros all they need—low maintenance varieties, winter hardy blends, special mixes for specific geographic problems, and expert help in selecting the right one.

And no matter what Northrup King turf seed the pros use, they get turf that's good looking and hard working.

Find out more about quality turf seed from Northrup King. Talk to your Northrup King representative or distributor.

Or talk to someone with great looking turf.

Northrup King Co., P.O. Box 959, Minneapolis, MN 55440.
