MATERIALS

Thermoplastics favored over metals in report

In Europe, engineering thermoplastics can be ex-
pected to continue to take market share away from
metals, despite oil price increases that would seem
to hurt hydrocarbon-based plastics, according to a
report by Frost & Sullivan, Inc.

The report says, "Steel, aluminum, zinc, copper,
and most other metals are more energy expensive
on a cost per unit volume basis than are plastics."
The 286-page report, entitled "European Market
for Engineering Thermoplastics," says, "The com-
petition between engineering thermoplastics and
zinc and aluminum diecastings has been won in
almost all applications by plastics."

And it adds, "Pending legislation (to lessen
automobile weight and improve safety) will also
stimulate the use of more thermoplastics in
automobiles.

Acid from fertilizers countered by lime

Almost everything man adds to and does to the
soil, except applying lime, tends to make the soil
acid. Any action that generates positive ions in the
soil—tilling, growth of plants, and fertilizers—cre-
ates acidity.

The greatest cause of soil acidity is the use of
ammonium-type fertilizers. Such fertilizers in-
clude animal manures, plant residues, organic ni-
trogen fertilizers, anhydrous ammonia, urea, am-
onium sulfate, and half of the nitrogen in am-
onium nitrate. This comes from both biological
and chemical activity.

According to the National Limestone Institute, it
requires about 3 pounds of limestone to neutralize
the acidity formed by one pound of nitrogen.
Because of the time required for lime to react and
the difficulty of even spreading, the association
suggests applying 5 pounds of limestone for each
pound of ammonium nitrogen applied.

MARCH 1980/WEEDS TREES & TURF 91
NEW DURSBN LABELS CLEAR WAY FOR NATIVE ELM BARK BEETLE CONTROL

New labels for Dursban are providing a backup defense against Dutch elm disease in states where the native elm bark beetle is the primary vector. The Environmental Protection Agency has approved a national label for Dursban 2E and a Local Needs Registration for Dursban 4E in Minnesota where research on native elm bark beetle management has been centered.

"A good sanitation program, including debarking of all elm firelogs, is still the top priority," points out Bill Phillipsen, extension entomologist at the University of Minnesota. "We're reaching the point, though, where cost and logistics in epidemic areas are making it very difficult to keep up with diseased tree removal and downed log disposal."

"In the Minneapolis-St. Paul-Bloomington area alone, estimates on diseased elms in 1979 range up around 77,000 trees. With present costs for labor and equipment, the price tag for removal and disposal will run in the neighborhood of $30 million. We find we're in the same 'catch-up' situation with Dutch elm disease that other communities faced in the lower Midwest and East about 10 to 20 years ago."

The research has been conducted in several communities over the past several months by Phillipsen and associates Mark Ascreno and Val Landwehr, under funding from the Minnesota Dept. of Agriculture Shade Tree Program. The product earlier was registered and has been used successfully in native elm bark beetle control programs in Canada.

DED in Minnesota

Dutch elm disease was first reported in Minnesota in 1961. As is typical of many infestations around the country, the disease had relatively little impact on elm populations for 12-14 years. Then DED multiplied rapidly.

"In the last five years, we've lost more than 20 times the number of elms killed in the first 14 years. The rate will continue to escalate unless comprehensive management programs are implemented," explains Phillipsen.

"Costs for tree removal are essentially unavoidable. If communities do nothing to slow down the spread of Dutch elm disease, they will still have to remove dead and dying trees to keep them from falling across power lines, into houses, over traffic routes and so forth. We're looking at practical ways to disperse these removal costs over several years."

From a total elm population of about 5 million trees, the Twin Cities seven-county metropolitan area still has 4,500,000 that are disease-free, according to Phillipsen. If DED is allowed to progress at its normal logarithmic rate, virtually all elms in that area will be destroyed over the next 10 years.

With today's cost of tree removal averaging nearly $400 apiece, the expense would add up to a staggering $1.8 billion. This does not take into account the aesthetic impact on communities, depreciation in home values due to loss of the majestic shade trees, or damage losses attributed to falling limbs and trees.

Two insects serve as elm fungus disease carriers—the smaller European and the native elm bark beetle. Both reproduce during the summer months in downed elm logs or diseased trees, which points up the importance of sanitation programs to deprive both insects of egg-laying sites, as well as to reduce the natural reservoir of disease fungus.

In some parts of the country, European elm bark beetles are the prevalent species. In Minnesota, however, native beetles far outnumber the European.

"In the northern two-thirds of Minnesota, the native beetle is the main and, in many instances, the exclusive carrier of Dutch elm disease," says Phillipsen. "In the southern third, the native is an important carrier along with the European beetle."

Insect studies indicate that only two or three percent of the overwintering European beetles are likely to be carrying the disease fungus. "In our studies, about 30 percent of the overwintering European beetles carried the fungus. It only takes one beetle to infect a tree."

Both insects do most of their damage in the spring when they emerge from overwintering sites. Natives emerge first, starting around mid-April or early May, and fly into larger branches of healthy elms to feed. Trees are particularly vulnerable at this time, when new growth is being added and rapid transmission of the fungus can occur.

European beetles emerge about a month later and feed on smaller twigs and branches. Disease fungus introduced at this time usually spreads more slowly through the tree. If disease symptoms—leaf wilt and brown discoloration in twig cross-section—are detected early enough, it may be possible to save most of the tree by cutting out the infected branches.

A key to stopping native beetles was discovered in a "weak link" in its life cycle, which makes it much more susceptible to insecticide treatment than is the European. Native beetles overwinter as adults in the bark along the lower trunk of healthy elms. European beetles seek out downed trees and logs, overwintering in the larval form.

"By treating the bases of healthy elms with Dursban, we've destroyed over 97 percent of the native beetles overwintering there," notes Phillipsen. "In addition to its effectiveness, another important advantage is that it doesn't repel the insects. The beetles do not avoid treated elms even when there are untreated trees nearby."

Application guidelines

Two formulations of the chlorpyrifos-based insecticide are registered for use in Minnesota—Dursban 2E and Dursban 4E. Application rate is .5 percent active ingredient solution with
water, sprayed to wet (not run-off) the basal 2-2½ meters (6-8 feet) of standing healthy elm trees (one gallon of 2E in 45 gallons of water equals .5 percent; enough for approximately 90 trees).

The entomologists do not recommend that this management technique be left to individual homeowners, because effective control of beetle populations must be handled on a communitywide basis. At present, trained municipal employees and licensed pest control operators represent most of the qualified applicators. The Minnesota SLN 24c label must be in the possession of the user at time of application.

"The best time for application is late August to mid-September," adds Phillipsen. "This would be just before native beetles start their search for overwintering sites. Extra care should be devoted to the basal six inches of the tree, including root flare. Young elms (up to 8 inches in diameter) and thin-barked elms are especially vulnerable to the beetles."

Fall treatment is preferred because beetles can introduce the fungus directly into healthy trees as they make their overwintering tunnels. The "bottom up" disease symptoms are similar to those associated with root graft transfer of DED from infected to healthy elms. Spring treatments also can be effective by destroying beetles as they emerge to begin their feeding and reproductive cycle. The research team has monitored Dursban insecticide effectiveness for more than nine months, so a repeat treatment in the fall should not be needed where spring applications are made.

"Tree spray programs we've outlined will normally be conducted early enough in the spring and late enough in the fall that they won't conflict with most of the ongoing sanitation projects," explains Phillipsen. "From this standpoint, communities will be able to utilize their available manpower and equipment without a lot of additional expense."

"The cost of insecticide will run about 25 cents a tree, assuming an average 33-inch-diameter trunk. Most communities already have low-pressure sprayers and water tanks that are used in present weed and insect control programs, which can be used for these applications as well."

Proven by owners for line clearing efficiency, and preferred by operators for precise tower control and bucket positioning. HI-RANGERs are No. 1 in utility and contractor preference for insulated aerial man-lifts. Patented HI-RANGER “3D” one-hand control, hydraulic tool line options, chip boxes, and other features may benefit your operations. Write for “4F-5F CATALOG”.

Alternative methods

Essentially all U.S. elms are susceptible to Dutch elm disease. In northern states, approximately 95 percent are American (white) elms, with the remainder made up of red elm and rock elm species. A few foreign species, including the Chinese and Siberian elms, are fairly resistant to Dutch elm disease. Some have suggested importing these to replace native elms that have been lost to DED.

“We’re not recommending this because they would serve as reservoir hosts for the disease, making it even more difficult to slow the destruction of our native elms,” says Phillipsen. “They have other drawbacks, too. They’re fast-growing, but brittle, so they tend to lose their branches. And they don’t have the shape and structure of the American elm.”

What about pheromone projects?

“The pheromone-trap method may show some promise in wild areas with only European beetle populations, but we haven’t discovered a similar sex attractant that works with native beetles,” replies Phillipsen. “We consider pheromone traps, at this point, to be a valuable monitoring tool for European beetle infestations.”

As for a large-scale program based on pheromone use, there are disadvantages. By attracting a large number of beetles to a certain area, again a reservoir of fungus and beetles will probably build up. And there’s the problem of isolating the treatment area. The best results obtained in recent tests indicate at least 3 to 13 percent of the beetles will still escape this method.

A great deal of research also has been focused on methods of combatting the DED fungus itself, instead of concentrating on the insect carriers. Are any of these being utilized on a significant basis?

“A variety of both chemical and biological agents have been tested as tree inoculants, usually under strictly controlled environmental conditions,” says Phillipsen. “In a few instances, they’ve given good results. So far, however, there is nothing that has proved consistently effective in controlling the disease fungus in field applications.

“Translocation of any substance throughout the tree is extremely unpredictable, depending on environmental factors like moisture and temperature, plus size, age, photosynthetic activity and other plant physiological conditions. The interrelationships are very complex.”

“Probably the greatest drawback, though, is cost. Most of these methods require specialized equipment and take more time. We feel our efforts should be directed primarily at aggressive sanitation programs to stop the disease carriers. And, since the native elm bark beetle essentially bypasses sanitation programs in its overwintering habits, we believe the insecticide spray method can prove to be a valuable augment to sanitation.”

Dursban is a product of Dow Chemical Co., Midland, MI.
Free Climbing Rope worth $57.

New, stronger more durable climbing, bull rope, Arbor-Plex™

An Arbor-Plex™ 12-Strand...a new Samson rope designed to replace manila for climbing and bull rope. Arbor-Plex has been extensively evaluated in the field and has proven itself with these advantages.

- Twice the strength of manila
- New Duron™ II polyester for more durability
- Firm "nubby" surface for good grip
- Stays flexible, throws well
- Good knot holding
- Resists chemicals and UV, won't mildew

Arbor-Plex is now available through Samson Distributors. Send for descriptive literature and name of local source. Samson, Dept. AP, 99 High Street, Boston, MA. 02110

How to take advantage of this offer:

1. Select a Bull Line
2. Make out a check payable to Samson for the amount of the Bull Rope
3. Fill out your shipping address
4. Take or send your completed form, including check, to your usual Arborist Supply Dealer.
5. Dealer will then forward check and form to Samson for redemption
6. Your Bull and Free Climbing Rope will be shipped direct from our factory.

Offer Expires June 1, 1980

Check one Bull Rope:

- 5/16" x 100 FT. $ 81.
- 5/16" x 120 FT. $ 91.
- 5/16" x 150 FT. $105.
- 5/16" x 600 FT. $302.
- 3/8" x 100 FT. $ 98.
- 3/8" x 120 FT. $111.
- 3/8" x 150 FT. $130.
- 3/8" x 600 FT. $395.
- 1/2" x 600 FT. $572.

SIZE STRENGTHS

1/2" 5000 LBS
5/16" 9000 LBS
3/8" 12,000 LBS
5/8" 17,500 LBS

Hahn, Inc. has introduced a self-propelled, all-purpose sprayer, the Spray-Pro. It has a 16-horsepower engine, 3-speed transmission and 160-gallon poly tank. Standard sprayer has a centrifugal pump and 16-foot boom. High flotation tires assure little turf loading. Optional features include hand gun kit, 22-foot boom, and high pressure pump kit.

Circle 704 on free information card

A mobile boom sprayer, the Mark III Spray-Hawk, eliminates all guesswork in applying chemicals to turf. It provides easy, fast spraying: accurate, uniform applications; and positive protection of fine turf. By coordinating the pressure of the sprayer with his natural walking speed, operator can apply the exact amount of turf chemical recommended. You can spray at the exact rates recommended by the manufacturer in a precise, uniform spray pattern to avoid harmful over-spraying and obtain more efficient and economical use of spray chemicals.

Spray-Hawk is lightweight, yet sturdily built with a stainless steel boom for long life. It has a positive on-off spray with easy-to-use pistol grip control. No-drip nozzles automatically close when pressure falls below 3 psi.

Circle 702 on free information card

A protective hood houses the entire application system of the Kleco drip-proof sprayer made by Buffalo Turbine AG Sales of Texas. This control system works for insecticides, herbicides, fungicides, liquid fertilizers, soil sterilants, and lawn dyes. It helps eliminate chemical drift due to wind and upward movements; protect operator from contact with spray regardless of wind direction; and reduce both stream contamination and the cost of spraying by requiring only the minimum application recommended by chemical manufacturers.

Reliable PTO-driven pump and other parts provide little maintenance problems. It will convert from three-point to dragtype hitch with gas-inversion power for practically all towing systems.

Circle 703 on free information card

Jumbo Sack semi-bulk container cuts losses and damages of changing bags in handling. There is no need to slit or seal bags, a major cause of contamination. Jumbo Sack, which safely contains 3,300 pounds, comes from Marino Systems, Inc.

Fault and cable locator by TelComm Products Div. of 3M is designed to help solve most underground sprinkler system control cable problems.

Circle 705 on free information card

The WS-480 Grounds Wheelie manufactured by Wheel Spray Corp. is a liquid chemical spreader with a ground-driven pumping system. It is motorless and does not require gasoline, batteries, cords, or water hoses. It applies liquid fertilizers, fungicides, herbicides, insecticides, and growth regulators. The twin wheel pumps spray a fan of solution 6 feet wide at 1,000 square feet per gallon. Coverage is relatively unchanged by the speed at which the sprayer is pushed; the faster it is pushed, the faster it pumps.

The pumping system and the 6-gallon container are made of corrosive-resistant materials. The spray comes from two nozzles in the form of tiny droplets providing a steady uniform application which greatly reduces costly chemical
Now! Ross brings you 3 for all... all the trees and shrubs you have!

Because ROSS knows specifically what’s good for your trees, you can stake your reputation on them.

| ROSS Super Tree & Shrub Stakes | 16-10-9 | A high food value combination, plus iron and zinc. |
| ROSS Super Fruit Tree Stakes | 16-5-10 | For bigger, better fruit, pre-measured feeding with iron and zinc booster. |
| ROSS Special Evergreen Tree Stakes | 8-8-8 | For Evergreens, Camellias, and Rhododendrons. A special balanced formula plus sulphur, iron and zinc. |

Now 3 great once-a-year Ross Formulas for all your trees and shrubs in economical, commercial bulk packs. Each commercial case contains approximately 155 stakes. That’s enough to feed more than 35 trees of 3” diameter. 20 solid nylon pounding caps are included in each case... they simplify driving stakes into the toughest soils. For best results, use 3 stakes for every 2” of trunk diameter, placing them at the drip line.

Order your Ross tree stakes from your Ross Daniels distributor. If they are unavailable in your area, order direct.

Budget stretcher.

New equipment is great. But today, tight budgets call for getting the longest life from all your equipment. That's where heavy duty Kawasaki engines can help you stretch your budget.

Specify Kawasaki engines on new equipment—or to replace worn out power plants on equipment you own. You get easy starting engines that run smooth. They've got the torque and horsepower to give new life to old equipment. They've got solid value features such as cast iron cylinder walls, stellite exhaust valve faces, heavy duty shafts and ball bearings on both ends of crankshaft and camshaft, just to name a few. And they run on regular or unleaded fuel.

Look into stretching your budget with reliable, durable replacement engines from Kawasaki.

The Power to turn People on.

Pinto Wild Flower Mix . . . the easy way to beautify any landscape. A blend of wildflowers like Bachelor's Button, Painted Daisy, Foxglove and Black-eyed Susan. A combination of annuals and perennials that requires no mowing . . . and it reseeds itself annually for a lush stand of colorful wildflowers.

Pinto Wild Flower Mix can be used anywhere . . . highways, private homes, waste areas, parks and non-playing areas on golf courses. It's a natural solution for areas that are difficult to mow. And it can be applied with a hydroseeder.

To beautify any area, try Pinto Wild Flower Mix . . . available either as wild flowers only, or mixed with sheep fescue to aid soil stabilization.

Available in 1-acre bags of 4 lbs. (wild flower seeds only) or 30-lb. bags (wild flower/fescue mix).

Pinto is also available in reclamation grass seed mixtures, formulated for hard-to-establish, minimal-maintenance areas.

---

The EH-4 truck crane, an electric/hydraulic model, for use on one ton and heavier trucks, holds 4,000 pounds yet weighs only 350 pounds. A manual extension reaches an additional 15 inches from its maximum vertical reach of over 11 feet. The crane stands 64 inches high above the truck bed in the stowed position. The truck's electrical system powers it and a double acting hydraulic cylinder provides both power up and power down to the boom. GS Industries, Inc. makes the crane.

Variable length auger extensions from the McMillen Div. of States Engineering Corp. are available to adapt McMillen 6 through 36-inch-diameter augers to most other hydraulic digging heads. They come in two sizes, 24 and 48 inches, both designed to be stored inside the auger shaft, adding 6 inches to the digging depth of the auger. The 24-
