blow was caused by him running pell-mell into the shortstop," says Frank Vible, Monsanto's assistant general counsel.

Despite the debate, the suit was settled out of court in September, 1985. The amount of the settlement cannot be disclosed.

**How hard is hard?**

The Ha I brook case may seem like the artificial vs. natural turf controversy is again being dredged to the forefront. That issue has been endlessly hammered into the ground it covers.

There's no denying the lush, green color of artificial turf shows up beautifully on TV...mud is non-existent...and it takes the abuse of rock concerts, tractor pulls, and rodeos, along with the usual sports wear-and-tear.

It also survives in domed stadiums.

But there's no denying the increased injury rates—from "turf toe" and infected abrasions to serious head injuries—its (yawn) predictability...and the scorching heat emitted from the artificial turf on hot days.

There's always room to debate. But, in the best interests of the players, the artificial and natural turf industries should stop arguing and each take a critical look at the questions raised by the Halbrook case:

- **How hard is hard?**
- **Should there be a standard for athletic fields?**

"There's a real question out there," Holland says. "To what extent does the hardness of the field play a part in injury?

"The tendency is to blame something else...the athlete's condition, the risk of injury inherent in the sport, the equipment, the particular way the fall or injury occurred. Where do you draw the line?"

In researching the case, Holland found studies and cases involving abrasions and turf toe, but little on hardness.

"I was really shocked at the lack of information about field hardness," Holland says. "The bottom line is...is hardness an issue? That was the whole focus in the case and we found that it is an issue, so we tried to define the issue."

**No excuse**

Field hardness is becoming such an issue, in fact, that researchers at Penn State University have begun studying the hardness of natural fields.

Holland turned up several impact studies.

MY PRIMARY BUSINESS AT THIS LOCATION IS:
(PLEASE CHECK ONE ONLY IN EITHER A, B OR C)

A. LANDSCAPING/GROUND CARE AT ONE OF THE FOLLOWING TYPES OF FACILITIES:
- Golf courses
- Sport complexes
- Parks
- Rights-of-way maintenance for highways, railroads & utilities
- Schools, colleges & universities
- Industrial & office parks/plants
- Condominiums/apartments/housing developments/hotels/resorts
- Cemeteries/memorial gardens
- Military installations & prisons
- Airports
- Multiple government/municipal facilities
- Other type of facility (please specify)

B. CONTRACTORS/SERVICE COMPANIES/CONSULTANTS:
- Landscape contractors (installation & maintenance)
- Lawn care service companies
- Landscape architects
- Extension agents/consultants for horticulture
- Other contractor or service (please specify)

C. SUPPLIERS:
- Sod growers
- Dealers, Distributors
- Other supplier (please specify)

Approximately how many acres of vegetation do you maintain or manage?

I would like to receive (continue receiving) WEEDS TREES & TURF each month: YES ☐ NO ☐

Your Signature: __________________________ Date: ________
The Professional Grounds Management Society and Weeds Trees & Turf magazine are proud to announce the “Landscape Manager of the Year” award, to be presented for the first time at the Landscape Expo in Chicago, IL, March 3-5, 1987.

Purpose of the award is to recognize superior job performance among landscape managers, to challenge those involved in the industry to achieve higher standards of excellence, and to bring national recognition to deserving managers.

Any person directly responsible for the professional maintenance of one or more landscapes is eligible to enter. Applicants will be judged according to job performance, honors and awards, procedures and philosophies, and contributions to the green industry. Applicants will be asked, at the time of entry, to submit four 5 x 7 black-and-white glossy photos and 10 color 35mm slides of current work areas with a short narrative on each.

CONTEST DEADLINE IS DEC. 31st, SO APPLY FOR OFFICIAL ENTRY FORM NOW!

TO OBTAIN OFFICIAL ENTRY FORM, PLEASE COMPLETE THESE QUESTIONS AND MAIL BEFORE NOVEMBER 1, 1986.

and Halbrook dished out thousands of dollars for private studies to support his case.

Halbrook, a mechanical engineer, became consumed with the studies and documents trying to find answers to his son's wrongful death. "I read every one of them at least half a dozen times," Halbrook says. They also discovered that in 20 years of making AstroTurf, Monsanto had never established a standard for hardness. But, then, neither had any other artificial turf manufacturer or the American Society of Testing Materials (ASTM), which has standards for most man-made products.

"Their excuse for failing to establish a standard in 20 years was to say that there's no standard on natural turf," Holland explains. "That's an improper perspective. They've created a product, put it in a different environment, and it works in a different way."

But Dr. Eliot Roberts, executive director of The Lawn Institute, says establishing a standard for natural turf fields will be necessary soon. With litigation getting out of hand, a law suit against a poorly-maintained natural turf field may not be far off.

In fact, it's difficult to even get university turf researchers to say, flat out, that natural turf fields are always safer than artificial turf fields.

What may be true is that a new artificial turf field could be safer than a poorly-maintained natural turf field. But without standards in either industry, researchers hesitate to make blatant statements.

One of the most critical studies addressing this issue was published by Dr. Douglas Bower and Bruce Martin in Medicine and Science in Sports in 1974. The study, "Impact absorption, new and old AstroTurf at West Virginia University," looked at impact absorption effects on four surfaces: sod (well-maintained Kentucky blue grass about 11/2 inches high); new AstroTurf (glued down to 5-year-old underpad); old AstroTurf; and asphalt.

The study found the "new AstroTurf surface approximates, but does not equal, a grass field in impact absorption capability...5-year-old AstroTurf surface has significantly decreased ability to absorb impact compared to the new AstroTurf."

The West Virginia study showed after only five years the surface had decreased dramatically. Parker Stadium's AstroTurf was six years old, the pad underneath eight. Besides the usual wear, ultraviolet light can break down synthetic surfaces and bacterial degradation can literally eat away the pad.

A standard for all

Dr. Bower, chief of sports medicine at West Virginia University Medical Center, completed an updated study in July. His results have not yet been published. But Bower is a big advocate of standards in all sports fields.

"I would like to see a standard for playing surfaces for specific sports," says Bower. "If artificial surfaces can meet that, fine."

Of course, Bower points out, a standard for a baseball field would differ from a football field or soccer field. But, he says, the standards should be set using good natural surfaces, not artificial turf, as a guideline.

Bower's research is unique. Although most companies "test" their own products, little objective research has been conducted.

Monsanto's Vible says he doesn't believe a standard is necessary for artificial turf, because it is "an essentially safe product."

"There is no vehicle for producing a general standard," Vible says. "There is no artificial turf trade association. ASTM has standards most of us abide by."

Holland points out, however, that ASTM has test standards, not safety standards, which take into consideration human tolerance. Besides, there's no requirement for companies to abide by test standards.

Penn State University graduate students Trey Rogers and Rich Henderson, under the direction of soil science professor Don Waddington, are measuring natural field hardness with a portable Clegg impactor. With this instrument, Rogers and Henderson will test fields under different conditions.

They will try to determine exactly how much affect various turf management methods, such as aerification and mowing height, actually have on the hardness of the field. Besides management methods, the researchers will check if turf species and root systems affect field hardness.

Henderson's tests so far have shown a decreased peak
And you thought DuPont Landscape Fabric was just for weed control

Throw a roll of DuPont "Pro" Landscape Fabric on your truck. You'll be amazed how many jobs it does, how good they'll look and how long they'll stay good-looking.

DuPont "Pro" controls weeds and lets air, water and liquid nutrients flow through. So stones and mulch won't wash away, and plantings stay moist. Black plastic can't match that.

DuPont "Pro" also helps keep traffic and freeze/thaw cycles from heaving walks and patios. It fights erosion around streams, ponds and retaining walls. All of which helps your jobs keep that just-installed look for years.

DuPont "Pro" Fabric. It's more than you thought, and just what you need. For a free brochure, write DuPont Company, "Pro," Room G50476, Wilmington, DE 19898.
An Important Message About Embark® PGR

"Embark PGR is now exclusively marketed world-wide by PBI/Gordon, and thus is a member of our vegetation management products family. If you have been using Embark PGR, perhaps we can help you further enhance its value. If you haven’t been using it, we would appreciate an opportunity to show you how it can reduce your mowing and trimming costs."

Everett Mealman,
President
PBI/Gordon Corporation

Plant Growth Regulators are surely the most effective tool that has ever been introduced into the field of vegetation management. But vegetation management is not a singular activity. Rather it consists of many individual activities, all of which pose special problems and opportunities for the use of a PGR.

It may well be that a rose is a rose, but using a PGR for highway vegetation management in Pennsylvania can require a different program than a similar problem in Minnesota.

Certainly you understand that using a PGR to replace hand pinching of azaleas, or changing the growth pattern of trees under utility wires, or reducing the mowing frequency along highways or in cemeteries, are totally different breeds of cat and will require different reaction from PGRs.

And that is precisely why both Atrimmec® Plant Growth Regulator (Dikegulac sodium) and Embark PGR (Mefluidide) are now marketed exclusively by PBI/Gordon. Formulating and marketing special products from somebody else’s molecule to secure highly specialized results is PBI/Gordon’s cup of tea.

Mowchem is the trademark used by May & Baker LTD for Mefluidide/Embark PGR in U.K. This picture was taken in Bibury, Gloucestershire, England and demonstrates how they are able to hold grass at an acceptable height in a weed-free condition with a spring application of Mefluidide plus a selective broadleaf herbicide and one mowing per year.
"When I visit our warehouse in Kansas City, and see products like Embark PGR, Atrimmec, Trimec, and Ferromec, all together under the same roof, I almost wish that I worked in the warehouse shipping them out. But I'll admit I also enjoy working in the front office and seeing the orders come in."

Everett Mealman

Who but PBI/Gordon could have combined different esters with dicamba to make the legendary Super Trimec® Broadleaf Herbicide? Who but PBI/Gordon could have come up with a patented process to bond ferrous sulphate with a urea molecule to make Ferromec® Liquid Iron Complex, a sprayable iron that produces green up in turf, trees, shrubs, and herbaceous plantings?

And who but PBI/Gordon is going to plumb the depths of PGRs to find the synergistic combinations that can maximize their power for vegetation management professionals!

Embark® PGR is a registered trademark of 3M.
Trimec®, Ferromec® and Atrimmec® are registered trademarks of PBI/Gordon Corporation.

more shock absorbancy. If it’s brown, it shows immediately.”

If a standard for athletic field hardness is established, all athletes would be aware of the type of surface they are playing on and its degree of hardness, whether artificial or natural.

Athletic field managers, researchers, and artificial turf manufacturers need to work together in establishing such hardness standards. Because one death is one too many.

AN ACT OF GOD?

You’ve heard it before. Injuries are beyond your control. But experts tell WT&T that the athletic field manager can make his field safer. Here’s how.

by Heide Aungst, associate editor

At high schools and grade schools throughout the country, it’s a well-kept secret. Those who dare to whisper the truth are quickly hushed.

“It’s an act of God,” they’re told. God’s will.

But injuries on natural athletic fields are not all “acts of God.” The truth is that many could be prevented. Injuries are frequently caused by poor field construction, cheap seeding, and haphazard management practices.

Young athletes, at the mercy of “responsible” adults, are falling on jagged rocks, twisting ankles in undulations, and tackling each other on hard, compacted fields.

Penn State University has published possibly the only study dealing with the relationship of field maintenance to injuries. In December, 1984, professors Don Waddington (soil science), John Harper (agronomy extension), Chauncey Morehouse (physical education/director of the Sports Research Institute), and William Buckley (health education), published the study “Turf management, athletic-field conditions, and injuries in high school football.”

The researchers evaluated varsity and practice fields at 12 Pennsylvania high schools for soil properties, field surface (undulations, stones, roughness), vegetative characteristics, and maintenance factors. They collected injury data throughout the season. (Only 10 schools turned in complete injury statistics.)

Of the 210 injuries reported, 44 (20.9 percent) may have been caused by field conditions.

Waddington says the study has been criticized for being on such a small scale, but it clearly illustrates that a connection exists between field conditions and some injuries.

The problem results from school administrators assigning someone, such as a janitor, without proper knowledge, to care for a field. Administrators often cite budget restrictions as the reason for failing to hire qualified field managers.

“My attitude is you can’t afford not to pay someone,” says Dr. Henry Indyk, extension specialist in turfgrass management at Rutgers University. “I can use the same philosophy in hiring a teacher in the school system. An athletic field is a very important part of a kid’s education.”

The budget also is to blame for lack of proper equipment and fertilizer.

Some corners can be cut to manage a safe athletic field at low cost. But, other factors should never be neglected.

Get advice

The first step in either building or renovating a field is to consult a local extension agent. “I don’t know how many people know we’re here,” says Dr. Dave Chalmers, extension agronomist at Virginia Tech. “We’re recognized more in rural areas, than urban.”

Extension agents can be found at...
