WE REMEMBER WHY YOU CALL IT PAYLOAD.

It's very simple. The more your trucks can carry, the greater your profit potential.

That's why we offer lawn and landscape businesses a series of low cab forward trucks with payloads ranging from 5,751 to 22,790 pounds:* the GMC Truck Forward and Chevrolet Tiltmaster W4, W5, W6, W7 and W7HV series of low cab forward trucks.

W6 Series Model

They're easy to maneuver in tight spots, with their set-back front axle and standard power steering. They give you the great visibility of a panoramic windshield with their cab-over-engine design. And they're built to carry the specialized loads you need to carry. See your GMC Truck Forward or Chevrolet Tiltmaster dealer and see how the W Series can pay off with payload for your business.

*Payload includes weight of cargo, body, equipment and passengers.

### Cool-season insect control strategies

<table>
<thead>
<tr>
<th>Pest</th>
<th>Spring April–May</th>
<th>Summer June–August</th>
<th>Fall-early winter Sept.–December</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Chinch bugs</strong></td>
<td>When summer damage expected, preventive application of liquid or granular Dursban (1 lb. ai/A); Triumph¹ (1 lb. ai/A) may be used as soon as bugs are active. Complete applications of insecticides by first week in May.</td>
<td>Treat before severe injury with Dursban (1 lb. ai/A); Diazinon² (2.5-5.5 lbs. ai/A); Crusade² (3-4 lb. ai/A) or other labeled insecticides.</td>
<td>Treat if needed. Generally, infestation not high enough to warrant insecticides.</td>
</tr>
<tr>
<td><strong>Billbugs</strong></td>
<td>Same as for chinch bugs.</td>
<td>Treatment usually not appropriate at this time.</td>
<td></td>
</tr>
<tr>
<td><strong>Sod webworms</strong></td>
<td>Overwintered larvae can cause damage in April or May. When necessary, apply Diazinon² (5 lb. ai/A); Triumph¹ (1 lb. ai/A); Dylox or Proxol (6-8 lb. ai/A). Crusade² (3-4 lbs. ai/A) Use flush of water/liquid detergent to scout for infestation level.</td>
<td>Apply when damage is seen, or larvae are present. Use Dursban (1 lb. ai/A); Triumph¹ (1 lb. ai/A); Diazinon² (5 lbs. ai/A); Sevin-Sevimol (6-8 lbs. ai/A); Proxol-Dylox (6-8 lbs. ai/A); Crusade² (3-4 lbs. ai/A) or other labeled products.</td>
<td>Larvae cause little damage at this time. Treat in Sept. to reduce spring population.</td>
</tr>
<tr>
<td><strong>Cutworms</strong></td>
<td>Use insecticides that are effective against sod webworms. Apply late in the afternoon. Do not irrigate after liquid applications. Irrigate granular applications.</td>
<td>Use Orthene (1-3 lbs ai/A); Dursban (1 lb ai/A); Triumph¹ (1 lb. ai/A); Proxol-Dylox (8 lbs. ai/A); Crusade² (3-4 lbs. ai/A) Do not irrigate after liquid applications. Irrigate granular applications.</td>
<td>Same as for Summer.</td>
</tr>
<tr>
<td><strong>Greenbug aphid</strong></td>
<td>Aphid numbers too low to detect.</td>
<td>Orthene (1 lb. ai/A); Dursban (1 lb. ai/A); Diazinon² (2.5 lbs. ai/A)</td>
<td>Severe infestations may occur as late as Dec. Use same insecticides as in Summer.</td>
</tr>
<tr>
<td><strong>Grain mites</strong></td>
<td>If treatment is needed, use liquid Diazinon² (2-3 lbs. ai/A) or Dursban (1 lb. ai/A). Avoid repeated use of Sevin-Sevimol.</td>
<td>If needed, use spring treatment.</td>
<td>If infestations develop in December, use summer treatment.</td>
</tr>
<tr>
<td><strong>Grubs</strong></td>
<td>If treatment of overwintered grubs is needed, apply when all grubs are in the first two inches of surface soil. General or spot treatment with Triumph¹ (2 lbs. ai/A); Oftanol, Sevin-Sevimol or Mocap (5 lbs. ai/A) or Turcam (2-4 lbs. ai/A) may be used. Crusade² (4 lbs. ai/A). Irrigate as soon as possible after application. Green June beetle larvae are difficult to control at this time. Sevimol (2-4 lbs. ai/A) may be effective.</td>
<td>Existing grubs found in July or August may be treated with Triumph¹, Dylox, Proxol, Turcam, Oftanol, Sevin-Sevimol or Mocap. Apply at label rates. Crusade² 4 lbs. ai/A. If soil and/or thatch is dry, irrigate thoroughly before and as soon as possible after app. Treat green June beetle with Sevin (2-4 lbs. ai/A)</td>
<td>Treatment can be made as late as mid-late Sept. as long as grubs stay in first inch of surface soil. Triumph¹, Mocap, Dylox-Proxol at label rates may be effective</td>
</tr>
<tr>
<td><strong>Black turfgrass ataenius</strong></td>
<td>Dursban (1-2 lbs. ai/A) applied to fairways in April for control of overwintered, egg-laying adults, reduces potential for summer larval infestations. Retreatment after two weeks will provide best control.</td>
<td>If preventive applications were not made, spot or generally treat with Triumph¹ (2 lbs. ai/A); Proxol Dylox (6 lbs. ai/A); Turcam (2-4 lbs. ai/A); Crusade² (4 lbs. ai/A); or Mocap (5 lbs. ai/A) as needed.</td>
<td>Undeveloped larvae die with development of ground frost.</td>
</tr>

Dark blue-green MowLess blend stands out against a Southern California background. Drought and heat tolerant Mow-Less offers year-around color in areas not before considered possible.

**Mow-Less Saves You More**

- Lower vertical growth means less clipping removal!
- Darker blue-green color requires less nitrogen.
- Dense growth habit reduces competitive weeds.
- Natural insect and disease resistance reduces chemical tools.
- Heat, drought and shade tolerance mean wider range of adaptability.

Mow-Less Brand Tall Fescue blend was developed to save conscientious turf managers time, money and clippings.

Mow-Less is a blend of the latest generation of dwarf tall fescues. Today, Mow-Less is composed of Silverado, Tomahawk (5DX), Monarch and Eldorado. As newer varieties are developed, like 5PM and 59D, they will be included in Mow-Less.

The components of Mow-Less all contribute dark blue-green color, heat, drought, shade and insect tolerance naturally. Mow-Less has made inroads into areas that tall fescue has not traditionally been adapted. Is this the start of something big? We think it's the start of something small... with a big savings in mowing.
Choose Bayleton this year for the same reason everyone chose it last year.

And the year before that. And the year before that. And the year before that.
Year after year, BAYLETON fungicide has controlled the tough diseases. Like summer patch and dollar spot. Not to mention a broad spectrum of other turf diseases.

Plus, BAYLETON has provided excellent control of powdery mildew and rust on ornamentals.

That's why it's been a leading fungicide on the finest courses in the country for more than ten years.

As if that weren't enough, consider the fact that BAYLETON is systemic. Which translates into longer control.

Which is all good reason to treat your entire course with BAYLETON. Especially your fairways, since it keeps your customers from tracking disease up to your tees and greens.

For more information, contact Miles Inc., Specialty Products, Box 4913, Kansas City, MO 64120. (800) 842-8020.

It may be the most consistently rewarding choice you make.
Sodding vs. seeding: what's the best bet?

by Ronald C. Smith, Ph.D.

A healthy stand of turfgrass controls soil erosion, reduced dust, controls soil temperature, recharges groundwater, and reduces noise levels. In addition, it simply looks great, setting off a well-designed and installed landscape planting.

The four ways in which turfgrass is established are: seeding, sprigging, stolonizing and sodding. But no matter how you intend to establish turfgrass, proper soil preparation goes a long way to assuring success (see sidebar).

Seeding—To establish by seeding, here are some helpful hints:

- **Buy quality seed.** Purchase seed based on purity (the percentage of pure seed of the species being planted) and germination (the percentage of that species that can be expected to germinate). The higher these percentages are, the better; and the lower the “inert matter,” “weed seed” and “other crop” that shows up on the label, the better. This is not the place to cut corners.

- **Apply the seed at the proper rate** for the species: Kentucky bluegrass at 1 lb./1000 sq.ft.; tall fescue or perennial ryegrass at 7 lbs./1000 sq.ft.; fine fescues at 3.5 lbs./1000 sq.ft. In the contracting business, the tendency is to go heavier when in doubt, pushing the seed count to 25 to 30 seeds per square inch. This results in an excellent flush of dense growth, but creates problems with maturation of the stand, leading to possible die-out from diseases.

The methods of seed application vary widely—from a simple drop spreader, to a cultipacker, or to a hydroseeder (see chart).

Sodding—All four types of sod—mineral or upland grown sod, peat sod, washed sod, and biosod—result in an “instant lawn” which provides immediate soil stabilization.

Sodded turfs, like those that are being established from seed, need irrigation for successful establishment. With mature, properly harvested and handled sod, less overall water is needed than the seeded sites. This requires controller adjustments on the part of the contractor, or educational efforts directed at the property owner, to reduce watering frequency once the sod has rooted in.

Sod that is originally weed-free is a commonplace expectation from quality sod growers, thanks to good management practices and intelligent use of herbicides on their part. This virtual elimination of weeds for at least a year, if not indefinitely, is in stark contrast to the landowner needing repeat applications of herbicides for anywhere from one to three years before satisfactory control is achieved.

The professional sod grower has the seeding rate down to a science, resulting in a quickly matured sod that efficiently uses fertilizer and water, competitively crowds out many weeds, and has essentially no disease problems.

Modern sod harvesting equipment carefully cuts at a uniform thickness—as thin as possible to allow for quicker establishment—so the end user has a smooth, finished surface, even before rooting takes place.

Growers like Harley’s Sod of North Branch, Minn., track results from turfgrass researchers at regional universities. This allows them to continually improve their seed blends and mixes, selecting grass cultivars that have proven to have the most enduring qualities for their

Preparing the seedbed

- Since the landscape contractor often inherits a property where construction rubble is buried a couple of inches below the soil surface, here are the proper steps in soil preparation:
  1) **Deep till** any compacted soil or, if the soil is too heavy, use a chisel plow. Follow this with a rough disk or harrowing, leaving the surface rough to allow for a more gradual transition between the topsoil and subsoil. This rough grading establishes the surface drainage patterns for the turf’s final grade.
  2) **Uniformly spread** topsoil over the subsoil at a depth of four to six inches—the deeper the better.

To figure out how much topsoil is needed for an area, calculate it on the basis of about 3.5 cu.yds. needed for every 1000 sq.ft. and 1 inch of depth. For example, a 10,000 sq.ft. area, requiring topsoil six inches deep would need about 210 cu.yds. of soil (3.5 x 10 x 6 = 210).

3) **Check the topsoil** for pH, phosphorus, potassium and organic matter content. If organic matter is not 3 percent or more, add some in the form of peat or humus, to bring it to between 3 and 5 percent.

4) **Remove any rhizomes** that may be visible as the topsoil is being graded. These could be the residue of quackgrass or Canadian thistle and could cause a considerable problem in trying to get a quality turf established. Certainly, any rock or debris should be removed as well. The final surface should be firm, granular and slightly moist to assure good contact between the applied seed or sod.

5) **Work in any necessary fertilizer materials**, based on soil test results.

It has all too often been noted that this phase of turf establishment is an effort to save money or to win the bid. Suffice it to say that cutting corners here will simply result in compounded problems later.

—R.C.S.
The (not-so) secret of a gorgeous lawn is Oregon-grown Ryegrass

Search the world over and you'll not find another variety with all the qualities of Oregon-grown Ryegrass.

It's the turf grass that will normally germinate in 7-10 days, show excellent disease-resistance, stand up to heavy hard use, respond rapidly to fertilization and mow beautifully at heights ranging from \( \frac{3}{8} \) to \( \frac{1}{2} \) inches.

Ryegrass is available at lawn & garden stores, nurseries and seed dealers as either a utility grass or one that will produce "show quality" turf.

Thoroughbreds of the Ryegrass family are the dark green, fine-bladed turf-type perennials which are marketed under a variety of names. They often form the turf at golf courses and other areas where premium turf is a must.

If you prefer less "showy" turf, the choice may well be Linn Perennial Ryegrass. By comparison with the turf-type Ryegrasses, it exhibits bright green color and has a slightly broader blade.

However, it too will usually germinate in a week or more, is disease-resistant, durable and will quickly develop an extensive root system.

For more information and free brochures, see your seed dealer or write to:

region. Most growers use certified seed which assures genetic purity of the culti-
vars. Many northern growers use such dependable cultivars as Touchdown, Adelphi, Glade, Rugby, Trenton, Ram I and many others.

Some sodding failures are a possibility, most stemming from poor seedbed prepara-

- Bad edges that are not firmed enough to make good contact with the soil, resulting in edge drying and weed invasion. This is eliminated by light rolling as the sod is laid.
- Over-applying water. Ten to 14 days after installation, the watering frequency should be reduced to match the weather conditions and site exposure. This generally means that most sodded turf areas can look pretty good on about 1 to 1-1/2 inches of water per week. On a 10,000 sq.ft. lawn, this amounts to between 6,000 and 9,000 gallons of water per week.
- Shallow perched water tables where sod is to be laid on heavy clay soil can be avoided by developing a “transition zone.” Work about 1/2-inch of peat moss into the top inch or two of soil so that the change between soil types is not so abrupt.

**Conclusion**—The choice of turf establish-

- ment is often a budget-driven process. Seeding may cost one-fifth to one-eighth that of sodding, but I have never known a client who was unhappy with a proper sod job. Neither have I known anyone who

Sod growers are able to produce weed-free sod in a short time, then harvest it efficiently with modern machinery.

wanted to withhold final payment until full turf coverage was complete. Payment decisions are often based on emotional judgment: a positive one results in faster payment than a negative one. Sod usually wins out in this circumstance.

Logically, where water is not readily available for establishment, then seedling would work well. Many a site has been hydroseeded initially, then watered until emergence with that hydroseeder—yielding a good stand of grass for the purpose of that site.

—The author is an extension horticulturist and turfgrass specialist with North Dakota State University, Fargo.

Correction

- The chart accompanying our February spring fertilization article incorrectly listed O.M. Scott & Sons' Poly-S fertilizer as containing methylene urea. Poly-S does not contain methylene urea. It is a polymer encapsulated urea, SCU.

Roundup® herbicide is the ideal management tool when budgets are tight or manpower is limited. You can cover more ground in the same amount of time it would take using mechanical methods or pulling weeds by hand.

Better yet, Roundup gives you long-lasting control. So crews don’t have to keep coming back. You’ll be able to allot more manpower to other jobs and save wear and tear on equipment—getting the most out of your budget.

If you’re not already using Roundup, don’t waste another minute. Ask for our FREE brochure telling how Roundup combines ecology and economy.

You might think using less insecticide means you’ll have to put up with more insects. But that’s not necessarily the case. Because how you use your insecticide is as important as how much you use. With the right tactics, you can use a lot less and still get excellent results.

Here’s a good example. By mixing insecticide with insecticidal soap, you can reduce the amount of insecticide you need on your ornamentals by about fifty percent. Insecticidal soap controls most soft-bodied insects and mites. By adding insecticide, you’ll also take care of tougher insects, like scales and worms. University studies
