Control. Convenience. Affordability. All Wrapped Up in One Neat Little Package.

Introducing PENDULUM® WDG Herbicide In New Water-Soluble Bags.

PENDULUM® WDG herbicide is the over-the-top preemergent that controls more than 45 annual grasses and broadleaf weeds. At a surprisingly economical cost.

In fact, PENDULUM provides the same level of control as other leading preemergent herbicides, including Surflan¹, but for less money per treated acre. Without harming labeled ornamentals.

And thanks to our new pre-measured, water-soluble packages, PENDULUM is easier than ever to use. The bags dissolve entirely, and exposure to your employees is reduced.

Call 1-800-207-6910 to order, or see your distributor.

Always read and follow label directions.¹ Trademark, DowElanco

Our commitment to your success continues with TURFGO® products.

As part of our continuing commitment to turf care professionals, United Horticultural Supply proudly features our own TURFGO® line of fertilizers, chemicals and turf seed.

These top pros have discovered that TURFGO® products are premium quality in addition to being environmentally sound.

For example, TURFGO® Crabgrass Preventer plus Fertilizer contains TEAM,* a proven leader in crabgrass control. Regardless of weather, turf species or time of year applied, excellent results are predictable.

Recent studies conclude that TEAM is still a top performer. Plus, it’s safe for all turf and it won’t stain.

If you prefer it without fertilizer, we have TEAM 2G. Whatever your need, United Horticultural Supply has a product that performs as promised and is always in good supply. Call us at 1-800-847-6417 for more information.

IF YOU HAVEN'T USED BARRICADE YET, LISTEN TO THOSE WHO HAVE.

Bill Womac
Superintendent
Dunwoody Country Club
Dunwoody, Georgia
"Barricade's extra length of control is an advantage to us in the South, especially with our long, hot growing season. Overall, Barricade has proven to be more cost-effective for us than other preemergence herbicides we've tried. We plan to use more next year."

Steve Carr
Superintendent
Pocassett Golf Club
Pocassett, Massachusetts
"Barricade makes it easy for us to fine tune our control program, as the length of control is determined by the rate used. We've found that one application is all it takes to keep us crabgrass free until the start of cold weather."
Dick Stuntz
Superintendent
Alvamar Country Club
Lawrence, Kansas
"With the amount of flooding and heat we've had this season, most preemergence herbicides would have fizzled out by now — but not Barricade. It's still giving us excellent control."

John Freeman
Superintendent
Deerwood Country Club
Kingwood, Texas
"Our preemergence weed control program was too expensive. Rather than cut back we switched to Barricade. Now, for the same dollars, we not only get excellent control, but also more coverage. Plus, we have the advantage of using multiple applications and getting better control of a broader spectrum of weeds."

Barricade: Performance that's got everyone talking. Your best choice for consistent season-long control of crabgrass, goosegrass, foxtail, spurge and other problem weeds. For more information call your distributor or 1-800-435-TURF.

Fertigation: it's what you make it

by Ed Nash, PlantStar Fertigation

Depending on the season, weather conditions, and irrigation capability, fertigation can closely parallel a traditional dry application program.

- Imagine this: fertilizing an entire golf course or commercial landscape overnight with no labor.

- And this: prescription feeding turfgrass with a predictable degree of efficacy and efficiency.

- And this: distributing accurate amounts of nutrients for uniform growth and color, eliminating streaking or burning.

- And, finally, this: reducing the fertilizer budget both in quantity and cost.

Sound too good to be true? Then consider the advantages of fertigation, which is injecting liquid fertilizer into irrigation water. It’s easy, convenient, and—most importantly—the control rests in the hands of you, the manager.

Fertigation allows you to provide balanced levels of macro- and micro-nutrients, produces excellent turfgrass, and is environmentally prudent while saving money.

The concept of fertigation is by no means new. Florida alone has more than 1,000 fertigation systems on golf courses.

Traditional thought is that fertigation should be limited to areas where irrigation occurs frequently, such as on light, sandy soils, or where temperature and humidity play a major role in soil moisture. However, experience is proving that no matter where you operate, “if you irrigate, you can fertigate.”

Designing a system—Factors that will determine your success are: the different types of injection equipment, storage tanks and liquid handling systems, the variety of fertilizer blends, and fertilizer analysis. Fertigation can accomplish your agronomic goals during any particular season of the year. It can be done prudently, cost-effectively and agronomically—soundly—if you select the proper equipment and materials.

In today’s fertigation market, capacities of injection delivery pumps range from fractions of a gallon per hour to several hundred gallons per hour. Selecting a supplier whose components can achieve your goals is critical. Choosing a system too limited in its injection capacity and versatility can handicap you in reaping all the benefits of fertigation.

Timing makes a difference in your approach. Depending on the season of the year, weather conditions, and the ability to irrigate, fertigation can closely parallel a traditional dry application program.

For example, a typical golf course may be irrigating 80 acres of turfgrass. Choosing an injection system that could deliver approximately 170 gallons per hour of liquid fertilizer, such as the high analysis product Coron (28-0-0), in an eight-hour irrigation period would deliver 1.15 lbs. N/1000 sq. ft.

This illustration demonstrates that, with the proper fertilizer and the proper injection equipment, you can duplicate a conventional dry application in less time and without using labor and heavy equipment. High capacity equipment can be “dialed down” for the more standard use of fertigation, which is light, frequent applications of plant food. However, low volume systems cannot exceed their maximum injection capacity—thus the injection rates are limited.

Mimicking slow-release—Typical applications of soluble fertilizer can be a continual problem on turfgrass, in that it fosters peaks and valleys of color and growth, encourages shallow roots, and develops weaker turf that is prone to disease and slow to recover. These problems increase with the solubility and quantity of fertilizer applied.

Soluble fertilizer products are relatively

continued on page 40

Injection delivery pump capacity ranges from fractions of a gallon per hour to several hundred gallons.
The History Of Manhattan

1626: Peter Minuit barters Manhattan Island for $24 worth of beads, trinkets and cloth. A bargain.

1967: Manhattan turf-type perennial ryegrass, with genes from Central Park, New York, paces industry.

1968: Athletic field in Woodburn, Oregon is seeded with this 'kid proof' Manhattan ryegrass. Considered best soccer field in the area for 25 years.

1982: New, improved Manhattan II is introduced. It's denser, darker, rust resistant... and even more 'kid proof'.

1992: Endophyte is included for natural insect resistance.

What's Next? Manhattan III... the best gets even better!

"Best Selling Perennial" Ryegrass Of All Time"

CO-MARKETED BY
Turf Merchants, Inc.
33390 Tangent Loop
Tangent, Oregon 97389

FERTIGATION from page 38

inexpensive compared to sophisticated "slow release" products that are widely used and accepted. However, fertigation allows you to mimic the effects of expensive slow-release materials.

You can feed small amounts of liquid fertilizer during each irrigation cycle, or used and accepted. However, fertigation is inexpensive compared to sophisticated agronomic planning, a sufficient irrigation system, the proper choice of fertilizers, and a good injection system provide the right combination for optimum turfgrass performance.

Fertigation offers unique opportunities to meet the needs of turfgrass managers in the 1990s and beyond. Sound agronomic planning, a sufficient irrigation system, the proper choice of fertilizers, and a good injection system provide the right combination for optimum turfgrass performance.

'Micro-fertigation' opens application windows

- The concept of "micro-fertigation" is a staple of the fertilization program of Don Parsons, superintendent at Old Ranch Country Club in Seal Beach, Calif.

"Micro-fertigation" is not the application of micro-nutrients through the irrigation system. It is, however, the ability to apply nitrogen fertilizer any time and in small amounts through the irrigation system.

"Most of us would not consider making an application of 16 bags of ammonium sulfate on a 120-acre golf course. It is not practical to run a tractor and spreader over the golf course to apply 16 bags of fertilizer." Fertigation, however, is uniquely suited to this task.

The advantage of fertigation to apply tiny amounts of nutrient is that the superintendent can "dial in" the growth and color that he or she needs. The reduced application rates also reduce the possibility of excessive growth, thatch and disease. And it reduces the potential for nitrate leaching.

Parsons suggests a total rate of about 0.07 lbs. of actual nitrogen per 1000 sq. ft. as a good rule of thumb when fertigating. "Let the plant use up this nitrogen before making another application," he says. "This technique should promote a strong plant with a deep root system."

Parsons fertigated 170 times in 1992 but just 140 times in 1993, due to changes in weather patterns.

If there is a drawback to fertigation, Parsons says, it is that grass and weeds grow in places that they were not growing before. "Many areas in the rough that were never fertilized regularly now grow very vigorously. Our tree growth is also significantly better," he says.

"Many people feel they cannot use fertigation because of poor sprinkler distribution," Parsons further notes. "Fertigation will not make a poor sprinkler system better, but don't back away from it just because of poor sprinkler distribution. Fix the problem and carry on."

Parsons firmly believes, however, that minute and frequent amounts of nitrogen on turf have great potential.

Seashore paspalum gets around water restrictions

Great for its salt tolerance, this sub-tropical grass does, however, have a problem resisting some major weeds.

- Because of municipal restrictions on water for irrigation, many golf courses and recreational areas that are located near the ocean have turned to seashore paspalum grass.

Seashore paspalum is a very salt-tolerant grass that can be irrigated with water containing high salt levels. In fact, many turf managers irrigate the grass with brackish water, which is part seawater and part freshwater from ponds or pumped from wells located near the shore.

Seashore paspalum is a warm-season perennial grass native to tropical and subtropical regions of North and South America. Because of its salt tolerance, it is often found on seacoasts and around brackish ponds and estuaries. Seashore paspalum spreads by rhizomes and stolons, and the stolons and leaves of the grass are slightly more coarse than those of common bermudagrass.

Paspalum is blue-green in color, and has a texture that is similar to common Kentucky bluegrass.

The salt tolerance of seashore paspalum is superior to even bermudagrass. In fact, on golf courses in south Texas and southern California, salinity levels are above 25 mmhos/cm, and seashore paspalum grows quite well, unlike bermudagrass, which dies out.

Seashore paspalum can also be found growing in brackish water with salinity levels above 4,000 ppm total salts.

As a turfgrass, seashore paspalum shows good tolerance to close mowing, good wear tolerance and moderate shade and drought tolerance.

The cold tolerance of the grass is between that of bermudagrass and St. Augustinegrass, but it does not tolerate prolonged sub-freezing temperatures.

As a turfgrass, seashore paspalum shows good tolerance to close mowing, good wear tolerance and moderate shade and drought tolerance.

It is well suited to turf areas mowed at two inches or less, and can also be used in golf course roughs. Its quality improves as the mowing height is reduced and mowing frequency increased. Even at putting green heights of 1/4-inch, the grass is very dense. Seashore paspalum must be propagated from sprigs of sod. When sprigged at a rate of 200 bushels per acre, a complete cover could be expected in two to three months.
