Costs of Apple Production in Western Michigan:

Semi-Dwarf Planting - 108 Trees Per Acre

By Myron Kelsey¹ and Scott VanDerbeck²

THIS COST EVALUATION of apple production in western Michigan is an update of costs developed in small group discussions with apple growers in prior years. Growers described common growing and harvesting practices used by average apple growers of the area. They agreed upon the size of apple acreage, equipment and cultural practices generally used by an average apple grower.

These figures do not reflect the average cost of apple production for all growers because costs vary considerably from farm to farm.

The data can help a grower develop his costs and better evaluate his farm situation. Each of the appropriate tables in this report includes a "Your Farm Cost" column for a grower to note costs for a particular operation. Where his costs cannot be determined, the grower may wish to adjust and substitute the study data.

The data were assembled assuming equipment and labor available for a hypothetical farm of 100 acres of diversified tree fruit, including 40 acres of apples. However, the data in Table 1 are presented for 10 acres of apples since it may be easier for a grower to visualize many of the resource inputs on this basis. Per-acre costs, as shown in Tables 2 through 6, can be determined from Table 1, by dividing by 10.

(See Table 1 on pages 2-3.)

The full-time labor classification includes the working time of the operator and regular hired help devoted to apples. Operator labor is not considered a cash expense by producers; but to allow for differences in the proportion of work performed by regular hired help, which is a cash expense, or the operator, both have been included at the \$3.50 per hour rate. As a result, producers who do a major portion of the work may have a lower cash labor cost than the figures indicate.

Some major factors considered in the computation of equipment costs are initial cost, salvage value, years of life, annual usage, repair costs, insurance, interest and operating expenses such as gas and oil. The oper-

ating costs for each piece of equipment are charged to the crop in Table 1 on the basis of direct hourly use of the equipment.

Variable costs are those that change directly with increases or decreases in the acreage of apples or yield with harvesting cost. Examples of costs which vary with acreage are spray material, fertilizer, hired labor, and machinery operating costs. Costs that vary directly with harvest yields are piecework rates.

Variable costs incurred in apple production are categorized by labor, machinery and materials in Table 2. The details of hours and type of labor, machinery used and hours of use, and kinds and amounts of material used by operation are shown in Table 1. If a grower's costs for particular items are substantially higher than those shown, he may need to closely analyze those components to see if they can be reduced. A high cost for a particular component may be justified if it contributes to a sufficiently higher yield or improved quality.

The variable costs incurred in the harvesting of an acre with estimated total production of 400 bushels of apples are shown in Table 3. Labor is the major cost. Therefore, good labor management should enhance the profit picture. In most cases, there will be some higher or lower costs for some items associated with higher or lower yields.

The overhead, or fixed cost, for apple production (Table 4) includes allocation of machinery overhead on the basis of the proportion of total farm use in ap-

Table 2. Variable cost per acre of growing apples, semi-dwarf orchard, western Michigan, 1976.

Operation	Labor	Machinery	Materials	Total	Your farm cost
Pruning & brush removal	\$52.94	\$12.22	\$.00	\$ 65.16	_____
Mowing	5.25	4.89	.00	10.14	_____
Fertilization	4.38	1.21	37.08	42.67	_____

ples, interest on orchard investment, orchard depreciation, and property taxes. The fixed costs of machinery are allocated to apples on the basis of hours of use on apples relative to the total hours of use of the equipment on the farm. Fixed costs on machinery include depreciation, interest on investment, insurance and housing costs (interest, insurance and housing equal 9.7 percent of average value).

A grower should evaluate his own farm situation and decide whether fixed costs should be considered

Table 3. Variable harvest cost for 400 bushels of apples, semi-dwarf orchard, western Michigan, 1976.

	Total	Your farm cost
Labor		
Full time labor (8.00 hrs.)	\$ 28.00	_____
Part time labor (.75 hr.)	1.86	_____
Piecework labor (\$.45/bu.)	168.75	_____
Piecework drops (\$.30/bu.)	7.50	_____
Equipment use	30.08	_____
Total	\$236.19	_____
Cost per bushel	\$.59	_____

Table 4. Overhead costs for growing and harvesting one acre of apples, semi-dwarf orchard, western Michigan, 1976.

	Total	Your farm cost
Machinery	\$ 89.68	_____
Interest on land (\$450 × 8%)	36.00	_____
Interest on average orchard value (\$550 ÷ 2 × 8%)	22.00	_____
Orchard depreciation (\$550 ÷ 20 yrs.)	27.50	_____
Property taxes	10.00	_____
Total	\$185.18	_____

as part of the total cost for his decision-making purposes. For instance, orchard overhead is a fixed cost to the owner of an orchard, but a variable cost for the operator, if rented.

Per-acre yields are very important factors in determining production costs per bushel of apples (Table 6). Variable costs per bushel are based on the fact that preharvest costs per acre, such as spraying, pruning, mowing, etc., do not vary greatly regardless of the yield obtained.

Table 5. Total growing and harvesting costs for one acre of apples, semi-dwarf orchard, western Michigan, 1976.

	Total	Your farm cost
Variable growing cost	\$323.04	_____
Variable harvest cost	236.19	_____
Overhead cost	185.18	_____
Total	\$744.41	_____

Table 6. Effect of varying yield on cost/bushel for apples, semi-dwarf orchard, western Michigan, 1976.

Yield per acre	Variable growing cost	Variable harvest cost	Total variable cost	Your farm variable cost	Fixed cost	Total cost	Your farm total cost
----- Per bushel -----
