One of the most important components of a successful urban tree program is the selection of suitable species/cultivars for use in the landscape. Improper selections can lead to a host of problems, including interference with overhead utilities, clogged sewer lines, lifted sidewalks, insect/disease pests, and trees unable to survive in the climate or site in which they were planted. Such problems can frustrate tree-planting efforts and deplete financial resources.

It is obvious that adequate, reliable information is the key to avoiding many of the above-noted problems. In reviewing current literature, however, it becomes increasingly clear that much of the decision-making information has been compiled using data from various eastern and midwestern states. In fact, there is currently limited research specifically covering tree species/cultivars suitable for use in Michigan's urban areas.

With this in mind, a study was designed to identify suitable species/cultivars specifically for use in Michigan's urban areas, utilizing the expertise and experience of professionals involved in the tree care industry. An extensive list of 185 tree species/cultivars was selected and then evaluated by Michigan tree care professionals. The focus of this study was to evaluate not only traditional urban trees but also those trees that are currently not frequently used in urban areas. The intent was to produce a new classification of species/cultivars suitable for Michigan's urban environments. With more options in urban tree selection, tree professionals may be able to avoid many of the problems associated with matching a species with the site while increasing diversity in the urban tree population.

Methodology

The first step in creating the survey was to produce a list of species/cultivars to be rated. This was accomplished in several ways. The initial list was compiled from *Street Tree Fact Sheets* and the 1996 Lake County Nursery Catalog. This list was then sent to members of the Board of Directors of the Michigan Forestry and Park Association, Inc. (MFPA), a chapter of the International Society of Arboriculture, which was advising and funding the project. Each member reviewed/ commented on the list, and from their suggestions a new list was created and redistributed to the board for a second review before the survey was prepared for distribution.

The survey was mailed to 1,476 individuals in Michigan who had an affiliation with the green industry. They were selected based on either their membership in MFPA, or the Michigan Nursery and Landscape Association (MNLA), or if they appeared on the Dunn and Bradstreet listing for the industry. The individuals selected from the Dunn and Bradstreet list were chosen randomly; all members of MFPA and MNLA were selected. A second copy of the survey was sent to those individuals who did not respond to the first mailing.

The Survey

The first survey question asked the respondents to rate each tree on a scale of 0 (n/a), 1 (poor) to 4 (excellent), based on their direct observational experience in their profession. A mean value, excluding zeros, was then calculated. The second question asked the respondents to list the optimum planting site(s) for the same species (s=street, y=yard, p=park, u=utility, o=other). The survey also asked the respondents' occupation from a list, location in Michigan, years in the industry, years in that location and their USDA plant hardiness zone (4, 5 or 6).

Approximate range of average minimum temperatures for each zone:
- Zone 6: -10 degrees to 0 degrees F
- Zone 5: -20 degrees to -10 degrees F
- Zone 4: -30 degrees to -20 degrees F

2 Lake County Nursery Catalog. 1996. Perry, Ohio.

\(^1\)Includes respondents who did not list an occupation.

Results

From the 1,476 surveys mailed, 387 (26 percent) were returned. From those received, 300 (20 percent) had sufficient information to fully complete the survey. Table 1 summarizes the occupations and hardiness zones of the respondents to the survey. Table 2 lists all trees rated by all respondents in rank order. Table 3 lists all trees rated by all respondents, as well as appropriate growing location(s) as chosen by respondents. Table 4 lists those trees with the overall lowest ratings. The remaining tables (5-22) list the top species and appropriate location(s) by hardiness zone (4, 5 and 6) and by occupation (arborist, urban forester, landscape architect, landscape consultant, landscape contractor, nursery professional and other). At the bottom of each of the “Top Tree” tables are trees that were rated by less than 25 percent of the respondents. It is hoped that the listing of these less well known species will provide information for expansion of species usage.

Conclusion

Users should be cautioned that the authors do not rate trees but are providing data furnished by professionals with experience using the trees. As such, users would do well to look across professional lines, consider the number of respondents on which the various tables are based, and make comparisons and judgements accordingly.

Diversity of plantings is usually considered desirable, provided the species can grow well on that site and in that hardiness zone. Ignoring the realities of appropriateness for the sole purpose of diversity is folly. The use of these ratings can help to avoid such poor decisions.

The various rating tables present the top species rated by at least 25 percent of respondents in the category. The lower portions of the tables present trees rated highly but by less than 25 percent of respondents in that category. These may be especially interesting to consider because they are rated highly by the few who are familiar with them. They might be considered appropriate for personal trials.

Another serious concern is the suggested best location for a tree to be planted. Even though a tree may be ranked high, it may not be advised for all types of locations. Therefore, it is important to take into consideration the location in which the tree will be planted.

We hope that the information provided will help tree professionals make more informed decisions about species selection and lead to a greater diversity in planting.

Disclaimer

The ratings within this publication are not those of the authors, Michigan State University Extension, the Michigan Forestry and Park Association, Inc., or the Michigan Nursery and Landscape Association. The data provided have been furnished by professionals within the “green industry” who have experience using the trees. In a listing like this, some species ratings may be disputed by some people. Readers should use caution when selecting species and are advised to review various tables within this publication, as well as other literature, before making their final species selection.

Table 4:
Lowest Ranked Trees as Rated by All Respondents

Disclaimer
The ratings within this publication are not those of the authors, Michigan State University Extension, the Michigan Forestry and Park Association, Inc., or the Michigan Nursery and Landscape Association. The data provided have been furnished by professionals within the "green industry" who have experience using the trees. In a listing like this, some species ratings may be disputed by some people. Readers should use caution when selecting species and are advised to review various tables within this publication, as well as other literature, before making their final species selection.

Disclaimer
The ratings within this publication are not those of the authors, Michigan State University Extension, the Michigan Forestry and Park Association, Inc., or the Michigan Nursery and Landscape Association. The data provided have been furnished by professionals within the "green industry" who have experience using the trees. In a listing like this, some species ratings may be disputed by some people. Readers should use caution when selecting species and are advised to review various tables within this publication, as well as other literature, before making their final species selection.

Disclaimer
The ratings within this publication are not those of the authors, Michigan State University Extension, the Michigan Forestry and Park Association, Inc., or the Michigan Nursery and Landscape Association. The data provided have been furnished by professionals within the “green industry” who have experience using the trees. In a listing like this, some species ratings may be disputed by some people. Readers should use caution when selecting species and are advised to review various tables within this publication, as well as other literature, before making their final species selection.

Disclaimer
The ratings within this publication are not those of the authors, Michigan State University Extension, the Michigan Forestry and Park Association, Inc., or the Michigan Nursery and Landscape Association. The data provided have been furnished by professionals within the "green industry" who have experience using the trees. In a listing like this, some species ratings may be disputed by some people. Readers should use caution when selecting species and are advised to review various tables within this publication, as well as other literature, before making their final species selection.

Disclaimer
The ratings within this publication are not those of the authors, Michigan State University Extension, the Michigan Forestry and Park Association, Inc., or the Michigan Nursery and Landscape Association. The data provided have been furnished by professionals within the "green industry" who have experience using the trees. In a listing like this, some species ratings may be disputed by some people. Readers should use caution when selecting species and are advised to review various tables within this publication, as well as other literature, before making their final species selection.

Top Trees as Rated by Landscape Architects

Table 14:
Top Trees, Including Appropriate Location(s), as Rated by Landscape Architects Arranged Alphabetically by Genus

Disclaimer
The ratings within this publication are not those of the authors, Michigan State University Extension, the Michigan Forestry and Park Association, Inc., or the Michigan Nursery and Landscape Association. The data provided have been furnished by professionals within the "green industry" who have experience using the trees. In a listing like this, some species ratings may be disputed by some people. Readers should use caution when selecting species and are advised to review various tables within this publication, as well as other literature, before making their final species selection.

Disclaimer
The ratings within this publication are not those of the authors, Michigan State University Extension, the Michigan Forestry and Park Association, Inc., or the Michigan Nursery and Landscape Association. The data provided have been furnished by professionals within the "green industry" who have experience using the trees. In a listing like this, some species ratings may be disputed by some people. Readers should use caution when selecting species and are advised to review various tables within this publication, as well as other literature, before making their final species selection.

Disclaimer
The ratings within this publication are not those of the authors, Michigan State University Extension, the Michigan Forestry and Park Association, Inc., or the Michigan Nursery and Landscape Association. The data provided have been furnished by professionals within the "green industry" who have experience using the trees. In a listing like this, some species ratings may be disputed by some people. Readers should use caution when selecting species and are advised to review various tables within this publication, as well as other literature, before making their final species selection.

Disclaimer
The ratings within this publication are not those of the authors, Michigan State University Extension, the Michigan Forestry and Park Association, Inc., or the Michigan Nursery and Landscape Association. The data provided have been furnished by professionals within the “green industry” who have experience using the trees. In a listing like this, some species ratings may be disputed by some people. Readers should use caution when selecting species and are advised to review various tables within this publication, as well as other literature, before making their final species selection.
