Cabbage

Amount of chemical formulation to apply per acre (unless otherwise directed). Apply no closer to harvest than number of days given in parentheses. (RUP) = Restricted Use Pesticide. Consult bulletin E-959 for pictures of insects, life history and damage. See current Vegetable Crop Advisory Team Newsletter for up-to-date information on pest status and control. (Visit www.ipm.msu.edu/vegCAT.htm or use the order form in the back of the book to subscribe.)

NEMATODES
Sugar beet cyst, northern root-knot and root-lesion nematodes can reduce cabbage yields. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). If the plant-parasitic nematodes are present in population densities above the economic threshold for cabbage, crop rotation or application of a nematicide is recommended. The following nematicides are suitable for control of sugar beet cyst, root-knot and lesion nematodes in cabbage production. It is best not to plant cabbage on land infested with sugar beet cyst nematodes.

**FALL SOIL FUMIGATION (BROADCAST):**
1,3-D
Telone II, 25 gal/A (muck soil), 9-18 gal/A (mineral soil).
Fumigate in the fall when soil temperatures at a 6-inch depth are above 50°F. Inject the fumigant to a soil depth of 8 inches and lightly seal the soil immediately after application. Use soil fumigants only as directed on the label. In some limited situations soil fumigants can be applied in the spring in Michigan. Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tarping.

**PREPLANT SOIL TREATMENT:**
Mocap 15 G. Apply 34 lb/A up to one week before planting and incorporate to a depth of 3 inches. (RUP)

**SOIL TREATMENT AT PLANTING:**
Fenamiphos
Nemacur 15 G, 7.3 to 18.4 oz per 1,000 row feet. Apply in 6-15 inch band width. Application may be made prior to planting, at planting or immediately following transplanting. Incorporate mechanically or with overhead irrigation. Do not treat more than 50% of total field area. DO NOT ALLOW BANDS TO OVERLAP. May be used on seeded or transplanted cabbage. (RUP)

**INSECTS**

SEEDBED TREATMENT:
Apply treatments to soil according to directions to protect young seedlings in the seedbed before transplanting in field.

CABBAGE MAGGOT: Apply to seedbed surface and incorporate to 3 to 4 inches.
Diazinon AG 500, 3 qt. Apply only as directed. (RUP)

SOIL TREATMENT:
APHIDS:
Venom, 5 to 6 oz. (21 days) See label for application methods.
**Platinum**, 5 to 11 fl oz. (30 days) See label for application methods.

**Flea Beetle, Thrips:**
*Platinum*, 5 to 11 fl oz. (30 days) See label for application methods.

**Transplant Water Treatment:**
Treatments are applied in water around roots at time plants are set in field. Note: Treatment rates are given in amount of formulation per 100 gallons of water. Apply at rate of 1 cup solution per plant. Frequent agitation is needed with wet-table powders.

**Cabbage Maggot:**
*Diazinon* 50 WP (1 lb/100 gal) or *Diazinon AG 500* (1/2 to 1 pt/100 gal) Use only as directed. (RUP)

**Planting Treatment:**
Treatments applied at seeding.

**Cabbage Maggot:** Apply in a 4-inch band over row at time of seeding.
*Lorsban* 15 G (4.6 to 9.2 oz/1,000 ft of row) or *Lorsban 4 E* / *Lorsban Advanced* (1.6 to 2.75 fl oz / 1,000 ft of row) Use only as directed. (RUP)

**Foliage Transplanting:**
Platinum, 5 to 11 fl oz. (30 days) Use only as directed. (RUP)

**APHIDS, FLEA BEETLE:** Apply as band on each side of seed row or transplant row at time of seeding or sidedressed after plants become established. Treatments applied at seeding or transplanting are translocated into foliage systemically.

**SOIL Treatment After Transplanting:**

**APHIDS:** Apply as a post-seeding drench, transplant drench, or hill drench, or as a sidedress after plants are established. Imidacloprid

*Admire Pro. 4.4 - 10.5 fl oz. (21 days)*

*Nuprid 2 F, 10 to 24 oz. (21 days)*

**Cabbage Maggot:** Apply to the soil at base of plants after transplanting. Apply water to wet soil surface.
*Lorsban* 15 G (4.6 to 9.2 oz per 1,000 of row) or *Lorsban 4 E* / *Lorsban Advanced* (1.6 to 2.75 fl oz / 1,000 ft of row) Apply in a 4-inch band over row at time of seeding. Use only as directed. (RUP)

**Foliar Treatment:**
**Flea Beetle:** Apply as needed soon after plants emerge.

**Materials**

Disease.

There are presently no chemicals registered for use on this disease.

**SEEDBED TREATMENT:**

Apply treatments to soil according to directions to protect young seedlings in the seedbed before transplanting in field.

**CLUBROOT (Plasmodiophora brassicae):**

PCNB. Sterilize seedbed before planting (Appendix A) or apply to soil surface as a drench.

**Terraclor 10 G**, 200 lb (row) or 300 lb (broadcast). Row application: Apply in a 12 to 15 inch band by means of a suitable applicator and rototill to a depth of 4 to 6 inches. Broadcast application: Apply and disc and cross disc to depth of 4 to 6 inches. May be used on direct seeded crops.

**Terraclor 75 WP**, 30 lb in 25 gal of water (band) or 40 lb in 35 gal of water (broadcast). Band application: Spray as a 12 to 15 inch band centered on the row and incorporate to a depth of 4 to 6 inches. Broadcast application: Apply and thoroughly incorporate to a depth of 4 to 6 inches. May be used on directly seeded crops.

**DAMPING OFF (Pythium spp.), BASAL STEM ROT (Phytophthora spp.):**

**Mefenoxam.** Apply as a broadcast preplant incorporation or surface application. For banded applications use a 7 in. band.

**Note:** If natural rainfall is not expected before seeds germinate, incorporate mechanically before planting or water into the seed zone after planting with 1/2 to 1 in. of sprinkler irrigation.

**Ridomil Gold SL**, * 0.25-0.5 pt (Pythium) 1-2 pt (Phytophthora), or **Ridomil Gold WSP**, 1 to 2 lb (1/4 to 1/2 lb, surface application, Pythium only).

**WIRE STEM or BLACK ROOT (Corticium solani):**

**PCNB**

**Terraclor 10 G**, 110 to 150 lb. Row application (40 in. row spacing). Apply in an 8 in. band immediately prior to seeding.

**Terraclor 75 WP**, 10 to 15 lb in 35 gal of water (row) or 15 to 20 lb in 50 gal of water (broadcast). Row drench treatment: Apply 10 to 15 lb in 35 gal of water. Spray as an 8 inch band centered on the row.

**Terraclor F**, 1.9 to 2.8 gal in 35 gal of water (row) or 2.8 to 3.8 gal in 50 gal of water (broadcast). Row drench treatment: Spray as an 8 inch band centered on the row.

**TRANSPLANT WATER TREATMENT:**

**CLUBROOT (Plasmodiophora brassicae):**

**PCNB.** Apply in 100 gal of water using 1/2 pt per plant around roots at time plants are set in field. **Note:** Frequent agitation is needed.

*Materials marked with an asterisk are particularly recommended for problem infestations.

Carrots

Amount of chemical formulation to apply per acre (unless otherwise directed). Apply no closer to harvest than number of days given in parentheses. (RUP) = Restricted Use Pesticide. Consult bulletin E-959 for pictures of insects, life history and damage. See current Vegetable Crop Advisory Team Newsletter for up-to-date information on pest status and control. (Visit www.ipm.msu.edu/vegCAT.htm or use the order form in the back of the book to subscribe.)

NEMATODES
Northern root-knot, pin and carrot cyst nematodes severely reduce carrot quality and yields. Crop rotation is an essential part of nematode management in carrot production in Michigan. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). If the plant-parasitic nematodes are present, crop rotation or application of a nematicide will be recommended. The following nematicides are suitable for control of root-knot nematodes in carrot production. Nematicide failures have been observed with increasing frequency in sites with very high population densities, or where the carrot cyst nematode is the major problem.

FALL SOIL FUMIGATION (BROADCAST): 1,3-D

Inject the fumigant to a soil depth of 8 inches and lightly seal the soil immediately after application. Use soil fumigants only as directed on the label. In some limited situations, soil fumigants can be applied in the spring in Michigan.

Lightly seal the soil immediately after application. Use soil fumigants only as directed on the label. Correct soil moisture, temperature and soil structure is needed for soil fumigants can be applied in the spring in Michigan.

PREPLANT TREATMENT:
Vydate L, L, in-row. Apply 1 to 2 gal in a minimum of 20 gallons of water as a broadcast treatment. Apply within one week of planting and thoroughly incorporate to a depth of 4 to 6 inches. (RUP)

PLANTING TREATMENT:
Vydate L, in-row. Apply 1 to 2 gal in a minimum of 20 gallons of water in the seed furrow at planting. (RUP)

POST-PLANT TREATMENT:
Vydate L, Broadcast. Apply 2 gal/A in at least 20 gal water/A before emergence. Incorporate into the soil. (RUP)

INSECTS

PRE-PLANT TREATMENT:
WIREWORM: May be found in grassy or weedy fields. If wireworm are present, apply evenly to the soil surface and incorporate 4 to 6 inches deep prior to planting.

Cauliflower

Amount of chemical formulation to apply per acre (unless otherwise directed). Apply no closer to harvest than number of days given in parentheses. (RUP) = Restricted Use Pesticide. Consult bulletin E-959 for pictures of insects, life history and damage. See current Vegetable Crop Advisory Team Newsletter for up-to-date information on pest status and control. (Visit www.ipm.msu.edu/vegCAT.htm or use the order form in the back of the book to subscribe.)
**NEMATODES**

**FALL SOIL FUMIGATION (BROADCAST):**
Sugar beet cyst, root-knot and lesion nematodes can reduce cauliflower yields. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). If the plant-parasitic nematodes are present in population densities above the economic threshold for cauliflower, crop rotation or application of a nematicide is recommended. The following nematicides are suitable for control of sugar beet cyst, root-knot and lesion nematodes in cauliflower production.

1.3-D
Telone II, 25 gal/A (muck soil), 9-18 gal/A (mineral soil).
Fumigate in the fall when soil temperatures at a 6-inch depth are above 50°F. Inject the fumigant to a soil depth of 8 inches and lightly seal the soil immediately after application. Use soil fumigants only as directed on the label. In some situations soil fumigation can be applied in the spring in Michigan.

Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tarping.

**INSECTS**

**SEEDBED TREATMENT:**
Apply treatments to the soil according to directions to protect young seedlings in the seedbed before transplanting in field.

**CABBAGE MAGGOT:** Apply equivalent amount to seedbed surface and incorporate to 3 to 4 inches.
Diazinon AG 500, 3 qt. Apply only as directed. (RUP)

**SOIL TREATMENT:**

**APHIDS:**
Venom, 5 to 6 oz. (21 days) See label for application methods.
or
Platinum, 5 to 11 fl oz. (30 days) See label for application methods.

**FLEA BEETLE:**
Platinum, 5 to 11 fl oz. (30 days) See label for application methods.

**TRANSPLANT WATER TREATMENT:**
Treatments are applied in water around roots at time plants are being set in the field. Note: Treatment rates are given in the amount of formulation per 100 gals of water. Apply at rate of 1 cup solution/plant. Frequent agitation is needed with wettable powders.

**CABBAGE MAGGOT:**
Diazinon 50 WP (1 lb/100 gal) or Diazinon AG 500 (1/2 to 1 pt/100 gal) Use only as directed. (RUP)

**PLANTING TREATMENT:**
Treatments applied at seeding.

**CABBAGE MAGGOT:** Apply in a 4 inch band over row at time of seeding.

*Diseases marked with an asterisk are particularly recommended for problem infestations.
DAMPING OFF (Pythium spp.):  
* Mefenoxam. Apply as a broadcast preplant incorporation or a surface application. For banded applications use a 7 in. band.

**Note:** If natural rainfall is not expected before seeds germinate, incorporate mechanically before planting or water into the seed zone with 1/2 to 1 in. of sprinkler irrigation.

* Ridomil Gold SL, 0.25-0.5 pt.  
* Ridomil Gold WSP, 1 to 2 lb (1/4 to 1/2 lb, surface application.

TRANSPLANT WATER TREATMENT:  
Apply in 100 gal of water using 1/2 pt per plant around roots at time plants are being set in the field. **Note:** Frequent agitation is needed.

CLUBROOT (Plasmodiophora brassicae):  
PCNB  
* Terraclor 75 WP, 2 lb.  
* Terraclor F, 3 pt.  
For best results, use with disease free (clubroot) seedlings.

FOLIAR TREATMENT:  
BLACK ROT (Xanthomonas campestris): Apply treatment (lowest rates) in the field as soon as transplants are established.

DOWNY MILDEW (Peronospora parasitica): Apply when conditions favor disease.

* Fosetyl-Aluminum

* Aliette WDG, 2 to 5 lb, 7- to 21-day intervals. (3 days)

**Note:** Do not tank mix with copper fungicides.

or  
* Mefenoxam  
* Ridomil Gold SL, 0.125-0.25 pt. (7 days)

or  
* Mefenoxam/Chlorothalonil  
* Ridomil Gold Bravo, 1 1/2 lb. (7 days) Apply at 14-day intervals. Maximum 4 applications.

or  
Mono-, dibasic sodium, potassium and ammonium phosphites  
* Phostrol, 2.5 to 5 pt every 7 - 21 days.

or  
* Prophyt, 2 to 4 pt. (0 days)

or  
Acibenzolar-S-methyl  
* Actigard, 1 oz per 20 gal (ground) or 10 gal (aerial) of water. (7 days) Do not apply more than 4 applications / crop per year.

or  
Mandipropamid  
* Revus, 8 fl oz. (1 day)

**Note:** Fungicides that protect against Alternaria also provide limited downy mildew protection.

Celery

Amount of chemical formulation to apply per acre (unless otherwise directed). Apply no closer to harvest than number of days given in parentheses. (RUP) = Restricted Use Pesticide. Consult bulletin E-959 for pictures of insects, life history and damage. See current Vegetable Crop Advisory Team Newsletter for up-to-date information on pest status and control. (Visit www.ipm.msu.edu/vegCAT.htm or use the order form in the back of the book to subscribe.)

*Materials marked with an asterisk are particularly recommended for problem infestations.
Celery

NEMATODES
Root-knot, pin, needle and root-lesion nematodes can reduce celery yields. Fields with root problems of undetermined cause should be tested for nematodes (see Appendix C). If the plant-parasitic nematodes are present in population densities above the economic threshold for celery, crop rotation or application of a nematicide is recommended. The following nematicides are suitable for control of root-knot, pin, needle and lesion nematodes in celery production. Nematode-free transplants must be used to prevent serious losses.

FALL SOIL FUMIGATION (BROADCAST):
1,3-D
Telone II, 25 gal/A (muck soil), 9-18 gal/A (mineral soil).
Fumigate in the fall when soil temperatures at a 6-inch depth are above 50°F. Inject the fumigant to a soil depth of 8 inches and lightly seal the soil immediately after application. Use soil fumigants only as directed on the label. In some limited situations soil fumigants can be applied in the spring in Michigan.

Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tarping.

Metam Sodium
Vapam HL, 37.5 to 75 gal/A. Use higher rate for muck soil. Inject with shanks spaced 5 inches apart or to a depth of 4-10 inches in well prepared soil. If shanked, roll and irrigate treated surface to prevent escape of gas.

PREPLANT TREATMENT:
Vydate L, Apply 2 gal/acre in 20 gal of water in 8- to 16-inch band. Incorporate to a depth of 4 inches. (RUP)

PLANTING TREATMENT:
Vydate L, apply 0.5 to 1 gal/acre in at least 100 gal of water immediately after transplanting seedlings in the field. (RUP)

POST-PLANT TREATMENT:
Vydate L, apply 1 gal/acre in at least 100 gal of water as a foliar spray 3 weeks after transplanting. Apply again 3 weeks after first treatment. (RUP)

INSECTS

SOIL TREATMENT:
APHIDS: Apply to soil in narrow band 14 or fewer days before planting, as an in-furrow spray at planting, as a post-seeding drench, transplant drench or hill drench, as a sidedress after plants are established, or in drip or trickle irrigation water.
Imidacloprid

Lannate LV (1 1/2 pt) or Lannate SP (1/2 lb) (7 days) (RUP)
Radiant SC, 5 to 10 fl oz. (1 day) Do not make more than 6 applications or exceed 34 fl oz/acre per season.

CARROT WEEVIL LARVAE: Apply as a directed spray. Start when eggs or larvae are first seen and repeat in 2 to 3 weeks. Vydate L, 4 pt. (21 days) May also be used for nematode control at same time. (Special Michigan SLN label.) (RUP)

CARROT WEEVIL ADULTS: Apply when adults are first caught in traps or eggs are first seen. No materials are labeled specifically for this area, however, permethrin at the rates given below will give some control of carrot weevil adults.

ASTER LEAFHOPPER (Aster yellows): Apply if numbers exceed 14/100 sweeps. Repeat as needed, depending on number of leafhoppers. Over-treatment with permethrin or Guthion may cause increased aphid problems.

Mustang Max, 2.4 to 4.3 oz. (1 day) (RUP)

Permethrin
Ambush 25 W, 6.4 to 12.8 oz. (1 day) (RUP)
Perm-UP 3.2 EC (4 to 8 oz) or Pounce 25 WP (6.4 to 12.8 oz)

CARROT WEEVIL Adults: Apply when adults are first caught in traps or eggs are first seen. No materials are labeled specifically for this area, however, permethrin at the rates given below will give some control of carrot weevil adults.

ASTER LEAFHOPPER (Aster yellows): Apply if numbers exceed 14/100 sweeps. Repeat as needed, depending on number of leafhoppers. Over-treatment with permethrin or Guthion may cause increased aphid problems.

Mustang Max, 2.4 to 4.3 oz. (1 day) (RUP)

FOLIAR TREATMENT:
CUTWORM, ARMYWORM: Apply preventive treatments within 4 weeks of harvest.

Baythroid XL, 2.4 to 3.2 fl oz. (0 days) (RUP)

Cucumber

Amount of chemical formulation to apply per acre (unless otherwise directed). Apply no closer to harvest than number of days given in parentheses. (RUP) = Restricted Use Pesticide. Consult bulletin E-959 for pictures of insects, life history and damage. See current Vegetable Crop Advisory Team Newsletter for up-to-date information on pest status and control. (Visit www.ipm.msu.edu/vegCAT.htm or use the order form in the back of the book to subscribe.)

**NEMATODES**

Root-knot and root-lesion nematodes can reduce cucumber yields. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). If the plant-parasitic nematodes are present in population densities above the economic threshold for cucumber, crop rotation or application of a nematicide is recommended. The following nematicides are suitable for control of root-knot and root-lesion nematodes in cucumber production. Recent observations indicate that cucumber planting the year following a chemigated (metham) potato crop may provide benefits to the cucumber crop.

**FALL SOIL FUMIGATION (BROADCAST):**

1,3-D
Telone II, 9-18 gal/A (mineral soil).
Fumigate in the fall when soil temperatures at a 6-inch depth are above 50°F. Inject the fumigant to a soil depth of 8 inches and lightly seal the soil immediately after application. Use soil fumigants only as directed on the label. In some limited situations soil fumigants can be applied in the spring in Michigan. Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tamping.

**PREPLANT NEMATICIDE TREATMENT (IN-ROW):**

Mocap 15 G, at 13 lb/A (7-foot row spacing) or 2.1 lb/1000 row feet in a band 12 to 15 inches wide on top of the row at or just before planting. Mix with top 2 to 4 inches of soil immediately after application. Do not use as a seed furrow treatment or allow granules to contact seed. (RUP)

or

Vydate L, apply 2 gal (broadcast) or 1 gal (band) per acre. Apply before planting, incorporate 2-4 in into the soil. (RUP)

**INSECTS**

**SEED TREATMENT:**

**SEED CORN MAGGOT:**
Lorsban 50 SL, 2 oz/100 lb seed as slurry treatment only. (RUP)

**SOIL TREATMENT:**

**CUCUMBER BEETLE (STRIPED and SPOTTED), APHIDS, THRIPS:** Apply to soil in a narrow band 14 or less days before planting, as an in-furrow spray at planting, as a post-seeding drench, as a sidedress after plants are established or in drip or trickle irrigation water. Do not make more than 1 application per year.

  - Admire Pro, 7.0 - 10.5 fl oz. (21 days)
  - Nuprid 2 F, 16 to 24 fl oz. (21 days)

**CUCUMBER BEETLE:** Use in areas with high cucumber beetle pressure.

* Furadan 4 F, 2.4 oz/1000 ft of row. Apply at planting or transplanting in a 7-inch band, incorporate into the top 3 inches of soil, or apply in furrow and mix with the covering soil. (Special Michigan SLN label.) (RUP)

**APHIDS, FLEA BEETLE, CUCUMBER BEETLE, LEAFHOPPER, THRIPS:**

Platinum, 5 to 11 oz. (30 days) See label for application methods.

**APHIDS, THRIPS:**
Venom, 5 to 6 oz. (21 days) See label for application methods.

**FOLIAR TREATMENT:**
Cucumber plants may be sensitive to certain insecticide formulations. Make certain a problem exists before treatment. Read and observe restrictions on the label. To avoid killing bees, do not treat cucumbers during bloom. If treatment is necessary, see the Insecticide Effectiveness for bee toxicity.

**CUTWORM:** Apply if needed to prevent >1-5% stand loss.

**SEEDBED PREPARATION:**

**ROOT ROTS** (*Fusarium solani*, *Fusarium cucurbitae*, *Pythium* spp., *Rhizoctonia solani*): Grow transplants in disease free soil (sterilized) and fumigate fields before planting. To sterilize soil, use steam or fumigate with Chemicals suggested for seedbed sterilization in Appendix A. Follow manufacturer's recommendations for use with particular crops. Avoid planting until the soil is free of fumigant.

*Materials marked with an asterisk are particularly recommended for problem infestations.*
PREPLANT SOIL FUMIGATION:
DAMPING OFF, ROOT ROTS (Phytophthora spp., Pythium spp. Rhizoctonia solani): This method protects plants grown from seed or transplanted in the field. See Bulletin E-2099.

Soil sterilization by fumigation is best achieved by proper application of material. Correct soil moisture, temperature, and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or immediate tarping.

Garden Greens

After initial application, 2 supplemental post-directed applications at 1 lb (Ridomil Gold WSP) or 1 pt (Ridomil Gold EC) should be made at 30-day intervals. Spray should be directed at the base of the plants and cover 6 to 8 inches of soil on either side of the plants. Ridomil Gold must be moved into the root zone mechanically or by sprinkler irrigation. Spray may be applied with liquid fertilizer tanked in as a band treatment to either side of the plant. The foliar blight phase of Phytophthora cannot be controlled with foliar applications of Ridomil Gold.

Note: Observe limit of active ingredient/crop on label.

PREPLANT SOIL FUMIGATION:
FUSARIIUM, VERTICILLIUM WILT, PHYTOPHTHORA spp:
Preplant treatment (production fields). Most fungicides applied to the soil to control disease organisms will also control soil insects, nematodes and weed seeds.

Soil sterilization by fumigation is best achieved by proper application of material. Correct soil moisture, temperature, and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or immediate tarping.

Leeks

Amount of chemical formulation to apply per acre (unless otherwise directed). Apply no closer to harvest than number of days given in parentheses. (RUP) = Restricted Use Pesticide. Consult bulletin E-959 for pictures of insects, life history and damage. See current Vegetable Crop Advisory Team Newsletter for up-to-date information on pest status and control. (Visit www.ipm.msu.edu/vegCAT.htm or use the order form in the back of the book to subscribe.)

NEMATODES

Leeks are hosts for root-knot nematodes. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). Management of root-knot nematodes can be accomplished by using crop rotation. The benefits of utilizing nematicides for leeks grown in Michigan are undetermined at this time.

**NEMATODES**

Root-knot and root-lesion can reduce lettuce yields. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). If the plant-parasitic nematodes are present in population densities above the economic threshold for lettuce, crop rotation or application of a nematicide is recommended. The following nematicides are suitable for control of root-knot and root-lesion nematodes in lettuce production.

**FALL SOIL FUMIGATION (BROADCAST):**

Fumigate in the fall when soil temperatures at a 6 inch depth are above 50F. Inject the fumigant to a soil depth of 8 inches and lightly seal the soil immediately after application. Use soil fumigants only as directed on the label. In some limited situations, soil fumigants can be applied in the spring in Michigan. Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tarping.

NEMATODES

Muskmelons and watermelons are hosts for root-knot and lesion nematodes. These nematodes can reduce melon yields but yield losses in Michigan have not been documented. If you suspect nematodes are reducing melon yields collect root and soil samples for analyses as described in Appendix C. If the numbers of nematodes recovered from those samples exceed damage thresholds; control options will be suggested. Vydate 2L is labeled for use in melons.

Amount of chemical formulation to apply per acre (unless otherwise directed). Apply no closer to harvest than number of days given in parentheses. (RUP) = Restricted Use Pesticide. Consult bulletin E-959 for pictures of insects, life history and damage. See current Vegetable Crop Advisory Team Newsletter for up-to-date information on pest status and control. Always read and follow label Instructions carefully.
INSECTS

SEED TREATMENT:
If possible, buy treated seed.

SEED CORN MAGGOT: There is no chemical control currently available.

SOIL TREATMENT:
CUCUMBER BEETLE, APHIDS, THRIPS: Apply to soil in a narrow band 14 or less days before planting, as an in-furrow spray at planting, as a post-seeding drench, as a sidedress after plants are established or in drip or trickle irrigation water. Do not make more than 1 application per year.

* Imidacloprid
  Admire Pro, 7.0 - 10.5 fl oz. (21 days)
  Nuprid 2 F, 16 to 24 oz. (21 days)

CUCUMBER BEETLE: Apply in areas with high beetle populations.

* Furadan 4 F, 2.4 oz/1000 ft. of row. Apply at planting or transplanting in a 7-inch band, incorporated into the top 3 inches of soil, or apply into the furrow and mix with the covering soil.
(Special Michigan SLN registration.) (RUP)

APHIDS, FLEA BEETLE, CUCUMBER BEETLE, LEAFHOPPER, THRIPS:
Platinum, 5 to 11 oz. (30 days) See label for application methods.

APHIDS, THRIPS:
Venom, 5 to 6 oz. (21 days) See label for application methods.

FOLIAR TREATMENT:
Melon plants may be sensitive to certain insecticide formulations. Make certain a problem exists before treatment. Read and observe restrictions on the label. To avoid killing bees, do not treat melons during bloom.

CUTWORM: Apply if >1% of plants are injured.

* Asana XL, 5.8 to 9.6 oz. (3 days) (RUP)
  or
* Baythroid XL, 0.8 to 1.6 fl oz. (0 days) (RUP)
  or
* Bifenthrin (RUP)
  Bifenture EC, Brigade 2EC, Capture 2 EC, 6.4 oz. (3 days)

SLUGS
Deadline M-Ps 4% (20 to 40 lb) or Metaldehyde 3.5 G (30 to 40 lb) Apply between rows. Avoid contact with edible product.

DISEASES

SEED TREATMENT:

DAMPING OFF (Pythium spp., Rhizoctonia solani): If possible, buy treated seed. Use only as directed; over-treatment may cause injury.
Bacillus subtilis GB03
  Kodiak, 0.1 to 0.5 oz/100 lb seed (Pythium),
or
Captan
  Captan 300, Captan 30-DD, 1/2 fl oz/100 lb seed.
  Captan 400, 1 1/2 to 2 fl oz/100 lb seed.
or
Fludioxinil
  Maxim 4 FS, 0.08 to 0.16 fl oz/100 lb seed (Rhizoctonia).
  Commercial seed treatment plants only.
or
Thiram
  42-S Thiram, Thiram 50 WP Dyed, 4 1/2 oz/100 lb seed.

SEEDBED PREPARATION:

DAMPING OFF, ROOT ROT (Pythium spp., Rhizoctonia solani): Grow transplants in disease-free soil (sterilized) and fumigate fields before planting. To sterilize soil use steam or fumigate with Chemicals suggested for seedbed sterilization in Appendix A.
Follow manufacturer’s recommendations for use with particular crops. Avoid planting until soil is free of fumigant.

PREPLANT SOIL FUMIGATION:

DAMPING OFF, ROOT ROTS (Phytophthora spp., Pythium spp., Rhizoctonia solani), FUSARIUM WILT or ROOT ROT (Fusarium oxysporum): See bulletin E-2099. This protects plants grown from seed or transplanted in the field.

Soil sterilization by fumigation is best achieved by proper application of material. Correct soil moisture, temperature, and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or immediate tarping.
1.3 Dichloropropene/chloropicrin
  Telone C35, 13-136 gal. (RUP)
or
Metam Sodium
  Sectagon 42, Vapam HL, 37.5-75 gal.
or
Potassium N-methylidithiocarbamate
  Sectagon-K54, 30-60 gal.

*Materials marked with an asterisk are particularly recommended for problem infestations.
GREENHOUSE PREPLANT INCORPORATION:
DAMPING OFF (Pythium spp.), ROOT ROT (Rhizoctonia spp.):
Gliocladium virens GL-21
SoilGard 12 G, 1 to 1.5 lb per cubic yard. Biological control product that needs to be applied before disease development. Control may be limited under heavy disease pressure.

PREPLANT TREATMENT:
DAMPING OFF and COTTONY LEAK (Pythium spp.):
* Mefenoxam. Apply as a broadcast preplant incorporation or a surface application. For banded applications use a 7 in. band.
Note: If natural rainfall is not expected before seeds germinate, incorporate mechanically before planting or water into the seed zone after planting with 1/2 to 1 in. of sprinkler irrigation.
    * Ultra Flourish, 2 to 4 pt.

FOLIAR TREATMENT:
POWDERLY MILDEW (Sphaerotheca fuliginea, Erysiphe cichoracearum):
* Myclobutanil
    * Rally 40 WSP, 2.5 to 5 oz, 7 to 10 day schedule. (0 days) Do not apply more than 1.5 lbs per acre per crop.
    * Pyraclostrobin
    * Cabrio, 12-16 oz. (0 days) Alternate one-to-one with fungicides having a different mode of action.
    * Pyraclostrobin/Boscalid
    * Pristine, 12.5 to 18.5 oz. (0 days) To avoid crop injury, do not add adjuvants.
    * Thiophanate-Methyl
    * Topsin M 70 WP, Topsin M WSB, 1/4 to 1/2 lb. (0 days) Apply at 7 to 14 day intervals after disease appears.
    * Trioxystrobin
    * Flint, 1 1/2 to 2 oz, 7- to 14-day intervals. (0 days) Maximum 2 consecutive applications, 4 applications/year and 16 oz/season.
    * Quinoxyfen
    * Quintec, 4 to 6 fl oz, 10- to 14-day intervals. (3 days)
    * Azoxystrobin
    * Amistar, 3.5 to 5 oz. (1 day)
    * Quadris, 11.0 to 15.4 fl oz. (1 day)
    * Do not apply more than one foliar application of Amistar and Quadris or other strobilurin fungicide before alternating with a fungicide that has a different mode of action.
    * Azoxystrobin/Chlorothalonil
    * Quadris Opti, 3.2 pt every 7 - 14 days. (1 day)
    * Bacillus subtilis
        * Serenade, 6 to 8 lb every 7 days. (0 days) Biological control product that needs to be applied before disease development. Control will be limited under heavy disease pressure.

Always read and follow label instructions carefully.

**Note:** Most fungicides applied to control downy mildew may have limited efficacy against Phytophthora crown and fruit rot.

**NEMATODES**

Root-lesion, false root-lesion and needle nematodes can cause reduction in yields, especially in the presence of the Verticillium wilt fungus. Fields should be tested for nematodes prior to planting. If any of these nematodes exceed damage threshold estimates, soil fumigation in the fall may be recommended.

**FALL SOIL FUMIGATION (BROADCAST):**

1. **Telone II**, 25 gal/A (muck soil). Fumigate in the fall when soil temperatures at an 8-inch depth are above 50F. Inject the fumigant to a depth of 6 inches and seal the soil with a drag immediately after application. Use soil fumigants only as directed on the label.

Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tarping.

- **Metam Sodium**
  - Vapam HL, 37.5 to 75 gal/A (use higher rate for muck soil). Inject with shanks spaced 5 inches apart or to a depth of 4 to 10 inches in well pre pared soil. Follow immediately with a roller to smooth and compact surface. Light watering to the treated surface helps to prevent escape of gas.

**FOLIAR TREATMENT:**

**MINT ROOT BORER:**

Lorsban 4E / Lorsban Advanced, 2 to 4 pt. (90 days) Apply post-harvest when larvae are present. Follow with at least 1 inch of irrigation. (RUP)

**MINT FLEA BEETLE:** Apply prior to egg-laying activity (July 20 to August 10) if needed to control adult stage, which will reduce root-damaging populations of larvae the following year. Three applications, 7 to 10 days apart, may be needed to control severe infestations (common only in older fields). Timing is critical.

- **Actara**, 1.5 to 3 oz. (7 days) Do not exceed 12.0 oz/Acre per season.
- **Lannate LV (2 1/4 to 3 pt)** or **Lannate SP (3/4 to 1 lb)** (14 days) (RUP)

DISEASES

PREPLANT SOIL FUMIGATION:

VERTICILLIUM WILT (Verticillium dahliae): See Bulletin E-2099. Apply as a broadcast or row treatment, placing the fumigant at least 12 to 14 inches below the final soil surface.

Soil sterilization by fumigation is best achieved by proper application of material. Correct soil moisture, temperature, and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or immediate tarping.

1.3 Dichloropropene/chloropicrin

or
Metam Sodium
   Sectagon 42, Vapam HL, 37.5-75 gal.
or
Potassium N-methylidithiocarbamate
   Sectagon-K54, 30-60 gal.

FOLIAR TREATMENT:

MINT RUST (Puccinia menthae): Apply to plants 4 to 8 inches tall at 7 to 10 day intervals. Do not apply more than 3 times. Do not feed hay to livestock.
Azoxystrobin
   Amistar, 2 to 5 oz. (0 days fresh; 7 days processed)
   Quadris, 6.2 to 15.4 fl oz. (0 days fresh; 7 days processed)
Do not apply more than one foliar application of Amistar and Quadris or other strobilurin fungicide before alternating with a fungicide that has a different mode of action.
or
Chlorothalonil
   Bravo Ultrex, 1 lb. (80 days)
   or

POWDERY MILDEW (Erysyphe Cichoracearum): Azoxystrobin
   Amistar, 2 to 5 oz. (0 days fresh; 7 days processed)
   Quadris, 6.2 to 15.4 fl oz. (0 days fresh; 7 days processed)

DO not apply more than one foliar application of Amistar and Quadris or other strobilurin fungicide before alternating with a fungicide that has a different mode of action.
or
Sulfur
   Kumulus DF, 4 lb, 21-day intervals. (28 days) Do not apply unless buyer of oil has authorized use.
or

or
Myclobutanil
   Rally 40 WSP, 4 to 5 oz. (30 days)

Onions

Amount of chemical formulation to apply per acre (unless otherwise directed). Apply no closer to harvest than number of days given in parentheses. (RUP) = Restricted Use Pesticide. Consult bulletin E-959 for pictures of insects, life history and damage. See current Vegetable Crop Advisory Team Newsletter for up-to-date information on pest status and control. (Visit www.ipm.msu.edu/vegCAT.htm or use the order form in the back of the book to subscribe.)

NEMATODES

Northern root-knot, root-lesion, onion bloat, common needle and stubby-root nematodes can reduce onion yields. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). If the plant-parasitic nematodes are present in population densities above the economic threshold for onions, crop rotation or application of a nematicide is recommended. The following nematicides are suitable for control of northern root-knot, root-lesion, onion bloat and stubby-root nematodes in onion production.

FALL SOIL FUMIGATION (BROADCAST):

1,3-D
   Telone II, 25 gal/A (muck soil), 9-18 gal/A (mineral soil).
Fumigate in the fall when soil temperatures at a 6-inch depth are above 50F. Inject the fumigant to a soil depth of 6 to 8 inches and lightly seal the soil immediately after application. Use soil fumigants only as directed on the label. In some limited situations soil fumigants can be applied in the spring in Michigan.

Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to keep fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tarping.
or
Metam Sodium
   Vapam HL, 37.5 to 75 gal/A (use higher rate for muck soil).
Inject with shanks spaced 5 inches apart to a depth of 4 to 10 inches in well-prepared soil. Material should be applied with adequate water and the soil surface sealed (light watering) after the application.

*Materials marked with an asterisk are particularly recommended for problem infestations.

**SEED TREATMENT:**
**ONION MAGGOT:** Trigard-treated seed is available as a pelleted or film-coated seed. Check with your seed supplier.

**AT-PLANTING TREATMENT:**
**ONION MAGGOT:** Apply to open furrow immediately after seeding but before furrow is closed. Use on dry bulb onions only. Lorsban 15 G, 3.7 oz per 1,000 ft of row. (RUP)

**FOLIAR TREATMENT:**
**ONION MAGGOT:** Apply as a directed spray or drench in a minimum of 100 gallons of water to the base of onion seedlings or transplants during peak egg laying of the onion maggot adults. Proper timing is critical. Lorsban 4 E / Lorsban Advanced, 1 qt. (60 days) Use on dry bulb onions only. Maximum of 2 applications, maximum of 1 application if Lorsban 4 E or 15 G was used at planting (Special Michigan SLN label). (RUP)

NEMATODES
Northern root-knot nematodes can reduce parsnip yields. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). If the plant-parasitic nematodes are present in population densities above the economic threshold for parsnips, crop rotation or application of a nematicide is recommended. The following nematicide is suitable for control of root-knot nematodes in parsnip production.

FALL SOIL TREATMENT (BROADCAST):
Telone II, 25 gal/A (muck soil), 9-18 gal/A (mineral soil).
Fumigate in the fall when soil temperatures at a 6 inch depth are above 50F. Inject the fumigant to a soil depth of 8 inches and lightly seal the soil immediately after application. Use soil fumigants only as directed on the label.

In some limited situations soil fumigants can be applied in the spring in Michigan.
Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tarping.

NEMATODES

Northern root-knot nematodes can reduce pepper yields. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). If the plant parasitic nematode is present at a population density above the economic threshold for peppers, crop rotation or application of a nematicide is recommended. The following nematicides are suitable for control of root-knot nematodes in pepper production.

Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tarping.

FALL SOIL TREATMENT (BROADCAST):

1.3-D

Telone II, 25 gal/A (muck soil), 9-18 gal/A (mineral soil).
Fumigate in the fall when soil temperatures at 6-inch depth are above 50°F. Inject the fumigant to soil depth of 8 inches and lightly seal the soil immediately after application. Use soil fumigants only as directed on the label. In some limited situations soil fumigants can be applied in the spring in Michigan.

SOIL INJECTION:

Metam Sodium

Vapam HL, 37.5 to 75 gal/A (use higher rate for muck soil).
Inject with injector, shanks spaced 5 inches apart at a depth of 4 to 10 inches. Roll and irrigate treated surfaces to prevent escape of gas.

TRANSLANT WATER TREATMENT:

As needed.
VyeDate L, 2 pt in at least 200 gallons of water. Do not apply during periods of slow plant growth, such as when temperatures are below 45°F. (RUP)
This treatment should be followed by broadcast or band applications using ground equipment at 1 gal/A in 20-50 gal water. Response is usually best if application is made to seedling plants from flag leaf to 2 or 3 true leaves.

CHEMIGATION TREATMENT:

Metam Sodium

Vapam HL, 37.5 to 75 gal/A (use higher rate for muck soil).
Apply with an irrigation system. Soil should be moist prior to treatment See Bulletin E-2099. Do not plant for 14 to 30 days after treatment (the wetter the soil, the longer the waiting period).

INSECTS

AT PLANTING OR TRANSPLANTING:

APHIDS: For early season control.

Imidacloprid

DISEASES

SEED TREATMENT:
PRE-EMERGENCE DAMPING OFF (Rhizoctonia solani, Pythium spp., Phytophthora spp.): Bacillus subtilis GB03
  Kodak, 0.1 to 0.5 oz/100 lb seed (Pythium).
  or
  Captan
  Captan 30-DD, 2 1/3 oz/100 lb seed.
  Captan 400, 2 to 3 oz/100 lb seed.
  or
  Thiram
  42-S Thiram, Thiram 50 WP Dyed, 8 oz/100 lb seed.
  or
  Fludioxonil
  Maxim 4 FS, 0.08 to 0.16 fl oz/100 lb seed (Rhizoctonia solani).

SOIL FUMIGATION:
VERTICILLIUM WILT, PHYTOPHTHORA: Apply to production fields before planting. Note: Most fumigants applied to the soil for control of disease organisms will also control soil insects, nematodes and weed seeds.

Soil sterilization by fumigation is best achieved by proper application of material. Correct soil moisture, temperature, and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or immediate tarping.

1,3 Dichloropropene/chloropicrin
  Tefone C35, 13-35 gal. (RUP)
  or
  Metam Sodium
  Sectagon 42, Vapam HL, 37.5-75 gal.
  or
  Potassium N-methylidithiocarbamate
  Sectagon-KS4, 30-60 gal.

GREENHOUSE PREPLANT INCORPORATION:
DAMPING OFF (Pythium spp.) and ROOT ROT (Rhizoctonia spp.):
Gliocladium virens GL-21
  SoilGard 12 G, 1 to 1.5 lb per cubic yard. Biological control product that needs to be applied before disease development. Control may be limited under heavy disease pressure.

ROOT/STEM ROT (Rhizoctonia solani):
PCNB
  Terracil 400, see label for rates specific to soil depth.

PREPLANT OR AT PLANTING INCORPORATION:
DAMPING OFF (Pythium spp.), PHYTOPHTHORA CROWN, STEM and FRUIT ROT (Phytophthora capsici):
  * Mefenoxam, Ridomil and Ultra Flourish must be applied to the soil before the plants are infected with Phytophthora to obtain satisfactory disease control.
  * Ridomil Gold SL, 1 pt. (7 days)
  * Materials marked with an asterisk are particularly recommended for problem infestations.

Ultra Flourish, 2 pt. (7 days)
Incorporate mechanically before planting or move into root zone after planting with 1/2 to 1 inch sprinkler water. For banded applications, use 12- to 16-inch band. One supplemental directed application at 1 pt (Ridomil Gold EC) or 2 pt (Ultra Flourish) should be made 30 days later followed by foliar applications of Ridomil Gold/Copper (MENFXOM/COPPER), 2 1/2 lb (1/4 lb a.i.) (7 days). Make 3 to 4 applications of Ridomil Gold/Copper at 10 to 14 day intervals.

Note: Observe limit of active ingredient/crop on label.

FOLIAR TREATMENT:
GRAY MOLD (Botrytis spp.), CLADOSPORIUM LEAF MOLD (Cladosporium capsici), SCLEROTINIA WHITE MOLD (Sclerotinia sclerotiorum):
Bacillus subtilis
  Serenade, 4 to 8 lb (Botrytis). (0 days) Biological control product that needs to be applied before disease development. Control may be limited under heavy disease pressure.
  or
  Potassium Bicarbonate
  Armicarb 100, 2.5 to 5 lb (Botrytis). (0 days)
  or
  Neem Oil
  Trilogy, 2 pt. (0 days)

ANTHRACNOSE (Colletotrichum spp.), ALTERNARIA (RIPE) ROT (Alternaria tenuis): Apply when disease threatens and every 7 to 10 days.
  * Azoxystrobine
  Amistar, 2 to 5 oz every 7 - 14 days. (0 days)
  Quadris, 6.2 to 15.4 fl oz. (0 days)
  Do not apply more than one foliar application of Amistar and Quadris or other strobilurin fungicide before alternating with a fungicide that has a different mode of action.
  or
  * Maneb
  Maneb 75 DF, Maneb 80 WP, 1.5 to 3 lb. (7 days)
  Manex, 1.2 to 2.4 qt. (7 days)
  or
  * Pyraclostrobin
  Cabrio, 8-12 oz. (0 days) No more than two applications before rotating to a different chemical.
  or
  * Trifloxystrobin
  Flint, 3 to 4 oz. (3 days) Do not apply more than three sequential foliar applications of strobilurin fungicides before alternating with a fungicide that has a different mode of action.
  or
  * Boscalid
  Endura, 2.5 to 3.5 oz. (0 days)
  or

NEMATODES

Root-lesion, root-knot and potato rot nematodes can reduce potato yields. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). If these plant-parasitic nematodes are present in population densities above the economic threshold for potatoes, crop rotation or application of a nematicide is recommended. Potato growers should not rely on a single strategy or tactic for their total nematode control program. The following nematicides are suitable for control of these nematodes in potato production.

Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tarping.

FALL SOIL TREATMENT (BROADCAST): 1,3-D

Telone II, 25 gal/A for muck soil, 9-18 gal/A for mineral soil. or 1,3-D and chloropicrin

Telone C-17, 27-30 gal/A for muck soil, 10-21 gal/A for mineral soil. (RUP) or

Metam Sodium

Vapam HL, 37.5 to 75 gal/A (use higher rate for muck soil). Inject with injector, shanks spaced 5 inches apart at a depth of 4 to 10 inches. Material should be applied with at least equal parts water or in a 2 to 1, water to fumigant, ratio. Seal surface after application.

Fumigate in the fall when soil temperatures at a 6-inch depth are above 50°F. Inject the fumigant to a soil depth of 8 inches and lightly seal the soil immediately after application. Use soil fumigants only as directed on the label. In some limited situations, soil fumigants can be applied in the spring in Michigan.

PREPLANT SOIL TREATMENT:

Mocap 6 EC, broadcast 1 to 1.5 gal/A within 2 weeks before planting until crop emergence. (RUP) or

Mocap 15 G, broadcast 40 to 60 lb and incorporate to a depth of 2 to 4 inches. (RUP)

SOIL TREATMENT AT PLANTING:

Mocap 15 G, 20 lb/acre (36 inch row spacing) or 1/4 lb/1000 row feet in a band 12 inches wide on the row at planting. Mix with the top 2-4 inches of soil.

*Materials marked with an asterisk are particularly recommended for problem infestations.
Potatoes

Note: Mocap use may result in delayed emergence particularly if excessive quantities of material contact seed. (RUP)
or
Vydac L, 1 to 2 gal in at least 20 gallons of water in furrow at planting. May aid in early season insect control. (RUP)

CHEMIGATION TREATMENT:
Metam Sodium
Vapam HL, 37.5 to 75 gal/A (use higher rate for muck soil) for mineral soil situations. Apply in the fall, although in some years spring application is possible.
Fall application in center pivot irrigation water. Have local product distributor provide additional application methodology and safety details from manufacturer. All recommended safety equipment must be installed to prevent groundwater contamination.

INSECTS
RESISTANCE MANAGEMENT:
Insecticide resistance is a severe problem with Colorado potato beetle. Crop rotation is the single most effective practice for managing Colorado potato beetle and resistance problems. If a neonicotinoid insecticide is used at planting, foliar application of any neonicotinoid later in the season must be avoided. Likewise, repeated application of any insecticide is likely to result in resistance problems.

SEED TREATMENT:
COLORADO POTATO BEETLE, POTATO LEAFHOPPER, APHIDS:
Imidacloprid

Admire Pro, 0.17 - 0.35 fl oz/100 lb seed. See label for application instructions.
or

Nuprid 2 F, 0.4 to 0.8 fl oz/100 lb seed.
or

Cruiser 5 FS, See label for application rates and methods.
or

Gaucho 480, MZ, 0.75 lb/100 lb cut seed. Use a seed dust metering applicator. See label for application instructions. Includes the fungicide mancozeb.

SOIL TREATMENT AT PLANTING:
WIREWORM: Broadcast evenly on soil surface and incorporate 4 to 6 inches deep prior to planting.
Mocap 15 G (27 to 40 lb) or Mocap 20 G (20 to 30 lb) (RUP)

WHITE GRUBS: Effective chemical control is not presently available. Rotation to a less sensitive crop like corn, with a soil insecticide, is recommended.

FURROW TREATMENT:
COLORADO POTATO BEETLE, POTATO LEAFHOPPER, APHIDS:
* Imidacloprid

Admire Pro, 5.7 - 8.7 fl oz. Apply in furrow, as side dress, or before hilling.
or

Nuprid 2 F, 0.9 to 1.3 oz per 1,000 row ft. Apply directly on seed in furrow. (Use high rate for muck soil. Consult label for rotation restrictions).
or

ApHIDS, FLEA BEETLE, LEAFHOPPERS: Apply in seed furrow or with fertilizer band at planting. Check the package label for further directions and limitations.
Phorate

Thimet 20 G, 11.3 oz (for light, sandy soils) 17.3 oz (for heavy, clay soils) /1,000 row ft. (90 days) May also help control Colorado potato beetle. (RUP)

APHIDS, FLEA BEETLE, COLORADO POTATO BEETLE, LEAFHOPPER:
Platinum, 5 to 8 fl oz. (30 days) Apply as an in-furrow spray on the seed piece, impregnated on dry, granular fertilizer before or during planting, at plant emergence or as a direct spray at base of plant during last hilling operation.

COLORADO POTATO BEETLE:
Platinum Ridomil Gold, 34 fl oz. (12 hour) Impregnate on fertilizer at planting. Do not use other neonicotinoids at planting.

FOLIAR TREATMENT:
FLEA BEETLE: Apply if there are more than 50/25 sweeps. May occur soon after plants emerge and again in late July and August.

Diseases

DISEASES

SEED TREATMENT:

Fusarium Tuber Rot (Fusarium spp.): Fall treatment. Treat seed going into storage or at the time of shipping. This must be done at least 6 weeks before planting.

Thiabendazole

Mertect 340, 0.42 fl oz/ton of potatoes. Apply in enough water for complete coverage. Apply as a spray to potato tubers (seed and table stock) at time of storage and again at removal. See manufacturer's recommendations for equipment and methods to use. Treatment may be applied to washed or unwashed potatoes.

SOFT ROT and BLACK LEG (Pectobacterium carotovorum):

Streptomycin sulfate

Agri-mycin 17, 100 ppm. Mix with Maxim 4FS or Maxim MZ.

Bac-master, 100 ppm. Mix with Maxim 4FS or Maxim MZ.

SEED TREATMENT AND HANDLING:

Fusarium Tuber Rot (Fusarium spp.): Pre-planting treatment. Dust or spray cut or whole seed before planting.

Captain

Captain 10 Potato Seed Protectant, 0.75 lb per 100 lb cut seed pieces.

or

Mancozeb

Dithane F-45 Rainshield, 2 pt per 50 gal water. Treat as above.

or

Tops MZ 8.5 DS, 0.5 lb per 100 lb seed.

Use only as directed. Note: DO NOT feed treated seed to livestock.

Rhizoctonia Disease (Rhizoctonia solani): Dust cut or whole seed just before planting.

Evolve, 0.75lb/100 lb seed.

or

Fludioxinil

Maxim 0.5 D, 0.5 lb per 100 lb seed potatoes.

or

Maxim 4 FS, 0.08 fl oz. Note: If Maxim 4 FS is used for potatoes for seed production, a labeled rate of mancozeb seed treatment dust must be applied to seed tubers after the Maxim 4 FS treatment. Alternatively, an in-furrow application of Quadris at 6.1 - 9.2 fl oz/A may be used (34" row spacing).

or

Maxim MZ 0.5 D, 0.5 lb per 100 lb seed potatoes.

or

Moncoat MZ, 0.75 - 1.0 lb/100 lb seed potatoes.

or

or

Tops MZ 8.5 DS, 0.5 lb/100 lb seed.

or

PCNB

Blocker 4 F, an in-furrow application 5 - 10 pt/A applying at a rate of 10 - 20 gal water/A. Maximum of 10 pt per season (12 months).

Silver Scurf (Helminthosporium solani):

Fludioxinil

Maxim 0.5 D, 0.5 lb per 100 lb seed potatoes.

or

Maxim 4 FS, 0.08 fl oz/100 lb seed potatoes. Note: If Maxim 4 FS is used for potatoes for seed production, a labeled rate of mancozeb seed treatment dust must be applied to seed tubers after the Maxim 4 FS treatment.

or

Maxim MZ 0.5 D, 0.5 lb per 100 lb seed potatoes.

or

Moncoat MZ, 0.75 - 1.0 lb pre-plant per 100 lb seed. Maximum 1.0 lb per season.

Coniothyrium Minitans
Contans, 1 - 4 lb.

IN FURROW AT PLANTING TREATMENTS:
For control of seed-borne and soil-borne diseases.
BLACK DOT (Colletotrichum coccodes):
Azoxystrobin
Quadris, in-furrow at planting at 6.1 - 9.2 fl oz/A (34" row spacing). Maximum 7.5 pt/A/season. Note: A protectant partner such as an EDBC (mancozeb or metiram) or chlorothalonil product is recommended in the tank mixture to any strobilurine product. Strobilurines should also be used in rotation with a fungicide with a different mode of action.

RHIZOCTONIA DISEASE (Rhizoctonia solani):
Azoxystrobin
Quadris, in-furrow at planting at 6.1 - 9.2 fl oz/A (34" row spacing). Maximum of 7.5 pt/A/season. **LATE BLIGHT:** When vines are seriously infected at harvest time. Apply as necessary.

*Blue Viking Star Glow Powder 100 SC, 10 lb.*

*Blue Viking Star Shine Crystals 100 SC, 10 lb.*

**Note:** The Blue Viking Concentrates should only be applied at vine-kill as they are phytotoxic.

or **Copper Hydroxide**

*Champ Formula 2 F, 2 to 5 pt.*

or **Copper-based compounds**

*Kocide 2.4 LF, 2 lb.*

**STORAGE DISINFECTION:**

To disinfect storages, boxes, truck beds, bags and equipment (tools, farm machinery), spray or drench surfaces with one of the following compounds:

*Sodium Hypochlorite*

*Chlorine solution, 1,000 to 2,000 ppm concentration.*

Commercial formulations vary in concentration; therefore, follow manufacturer’s recommendation when mixing solutions. Example: Perchlorin is a granule containing 70% calcium hypochlorite. It takes 5 teaspoons in 3 gallons of water to make a solution of 1,000 ppm. Rinse food containers and implements that come in contact with food after treatment.

or **Quaternary ammonium compounds**

*Aquahyme (E-Z Flo), Use according to manufacturer’s recommendations.*

or

*Materials marked with an asterisk are particularly recommended for problem infestations.*

106

Always read and follow label Instructions carefully
Green Shield, 0.5 fl oz per gallon of water.

or

Hy 2389 (Roehm & Has), Use according to manufacturer's recommendations.

or

Odorless Disinfectant (Haviland), Use according to manufacturer's recommendations.

The addition of a wetting agent with quaternary ammonium sprays or drenches is suggested to obtain more uniform coverage of surfaces. Use only those wetting agents recommended by the manufacturer because some are not compatible. Rinse food containers and implements that come in contact with food after treatment.

or

Soluble copper sulfate (blue vitriol; bluestone; etc.), 10 to 15 lb in 100 gallons of water.

or

Hydrogen peroxide

Oxidate, 1.5 to 2.5 fl oz per 100 gal water. Apply at 1 gal of solution per 2000 lb of tubers.

Note: It is important to remove all dirt and trash from surfaces to be treated.

PRE-STORAGE TREATMENTS FOR STORAGE DISEASES:

BACTERIAL SOFT ROT (Erwinia carotovora): Wash potatoes in chlorinated water to (1) disinfect tuber surfaces; (2) cauterize wounds; and (3) promote rapid formation of protective tissue over injured surfaces.

Hydrogen peroxide

Oxidate, 1.5 to 2.5 fl oz per 100 gal water. Apply at 1 gal of solution per 2000 lb of tubers. May also be applied in humidification water (see manufacturers' recommendations).

or

Sodium Hypochlorite

Chlorine solution. Add a concentrated stock solution of chlorine to wash water to give a concentration of 200 ppm (= 2 pt household bleach (5.25% sodium hypochlorite) per 60 gallons of water or 1 gal of bleach per 240 gallons of water).

Mix stock solutions of chlorine in earthen-ware crocks or plastic containers. DO NOT USE metal containers. Dry washed potatoes before bagging or bulk storing by passing hot air over the end of the sorting table. Usually, the sponge drying technique is inadequate without the addition of heat.

FUSARIUM DRY ROT (Fusarium spp.):

Hydrogen peroxide

Oxidate, 1.5 to 2.5 fl oz per 100 gal water. Apply at 1 gal of solution per 2000 lb of tubers. May also be applied in humidification water (see manufacturers' recommendations).

or

Thiabendazole

Merect 340, 42 oz flowable formulation in 100 gallons of water. Apply as a spray to potato tubers (seed and table stock) at time of storage and again at removal; 1 gal of solution per 2,000 lb of tubers. See manufacturer's recommendations for equipment and methods to use. Treatment may be applied to washed or unwashed potatoes. Addition of chlorine (200 ppm) to solution will help control bacterial soft rot. It is advisable to add a wetting agent when treating before storage to ensure good coverage.

LATE BLIGHT (Phytophthora infestans):

Mono-, dibasic sodium, potassium and ammonium phosphites

Phostrol, 0.1 gal/ton. Apply at 2-4 pt/2000 lb of tubers.

or

Prophyt, 13 fl oz/ton.

PINK ROT (Phytophthora erythroseptica):

Mono-, dibasic sodium, potassium and ammonium phosphites

Phostrol, 0.1 gal/ton. Apply at 2-4 pt/2000 lb of tubers.

Prophyt, 13 fl oz/ton.

PYTHIUM LEAK (Pythium ultimum):

Mono-, dibasic sodium, potassium and ammonium phosphites

Phostrol, 0.1 gal/ton. Apply at 2-4 pt/2000 lb of tubers.

Pumpkins

Amount of chemical formulation to apply per acre (unless otherwise directed). Apply no closer to harvest than number of days given in parentheses. (RUP) = Restricted Use Pesticide. Consult bulletin E-959 for pictures of insects, life history and damage. See current Vegetable Crop Advisory Team Newsletter for up-to-date information on pest status and control. (Visit www.ipm.msu.edu/vegCAT.htm or use the order form in the back of the book to subscribe.)

NEMATODES

Pumpkins are hosts for root-knot and lesion nematodes. These nematodes can reduce pumpkin yields but yield losses in Michigan have not been documented. If you suspect nematodes are reducing pumpkin yields collect root and soil samples for analysis as described in Appendix C. If the numbers of nematodes recovered from those samples exceed damage thresholds; control options will be suggested. Vydate 2L is labeled for use in pumpkins.

INSECTS

SEED TREATMENT:

SEED CORN MAGGOT:

Lorsban 50 SL, 2 oz/100 lb seed. See label for directions. (RUP)

SOIL TREATMENT:

CUCUMBER BEETLE (STRIPED and SPOTTED), APHIDS,

THRIPS: Apply to soil in a narrow band 14 or less days before planting, as an in-furrow spray at planting, as a post-seeding drench, as a sidedress after plants are established or in drip or trickle irrigation water. Do not make more than 1 application per year.

Imidacloprid

Admire Pro, 7.0-10.5 fl oz. (21 days)

Nuprid 2 F, 16 to 24 oz. (21 days)

CUCUMBER BEETLE:

Furadan 4 F, 2.4 oz/1000 ft of row. Apply at planting or transplanting in a 7-inch band, incorporate into the top 3 inches of soil, or apply into the furrow and mix with the covering soil. (Special Michigan SLN label.) (RUP)

*Materials marked with an asterisk are particularly recommended for problem infestations.
Pumpkins

APHIDS, FLEA BEETLE, LEAFHOPPER, THRIPS, CUCUMBER BEETLE:
Platinum, 5 to 11 oz. (30 days) See label for application methods.

APHIDS, THRIPS, SQUASH BUG:
Venom, 5 to 6 oz. (21 days) See label for application methods

FOLIAR TREATMENT:
Pumpkin plants may be sensitive to insecticide formulations under certain conditions. Be sure a problem exists before treatment. Read and observe restrictions or the label. To avoid killing bees, do not treat pumpkins during bloom. See the Insecticide Effectiveness table for bee toxicity.

CUTWORM: Apply when damage is first seen and repeat as needed.

DISEASES
SEED TREATMENT:
DAMPING OFF (Pythium spp., Phytophthora spp., Rhizoctonia
  solani): Use only as directed; over-treatment may cause injury.
  Gliocladium virens GL-21
  SoilGard 12 G, 1 to 1.5 lb per cubic yard.
  Biological control product that needs to be applied before disease
  development. Control may be limited under heavy disease
  pressure.

PRE-PLANT FUMIGATION:
PHYTOPHTHORA: Apply to production fields before planting.
  Note: Most fumigants applied to the soil for control of disease
  organisms will also control soil insects, nematodes and weed
  seeds.
  Soil sterilization by fumigation is best achieved by proper
  application of material. Correct soil moisture, temperature, and soil
  structure is needed for effective control of soil-borne pests.
  Special care is needed to seal fumigants in target zone for
  required time periods. This can be achieved by soil packing or
  immediate tarping.
  1,3 Dichloropropene/chloropicrin
    Telone C35, 13-35 gal. (RUP)

    Sectagon 42, Vapam HL, 37.5-75 gal.
  or
  Potassium N-methylidithiocarbamate
    Sectagon-K54, 30-60 gal.
  Do not plant for 14 to 30 days after treatment (the wetter the soil,
  the longer the waiting period).

GREENHOUSE PREPLANT INCORPORATION:
DAMPING OFF (Pythium spp.), ROOT ROT (Rhizoctonia spp.):
  1,3 Dichloropropene/chloropicrin
    Telone C35, 13-35 gal. (RUP)
  or
  Metam Sodium
    Sectagon 42, Vapam HL, 37.5-75 gal.
  or
  Potassium N-methylidithiocarbamate
    Sectagon-K54, 30-60 gal.
  Do not plant for 14 to 30 days after treatment (the wetter the soil,
  the longer the waiting period).

PREPLANT INCORPORATED:
DAMPING OFF and COTTONY LEAK (Pythium spp.):
  * Mefenoxam. Apply as a broadcast preplant incorporation or a
  surface application. For banded applications use a 7 in. band.
  Note: If natural rainfall is not expected before seeds germinate,
  incorporate mechanically before planting or water into the seed
  zone after planting with 1/2 to 1 in. of sprinkler irrigation.
    Ultra Flourish, 2 to 4 pt.

FOLIAR TREATMENT:
ALTERNARIA LEAF SPOT (Alternaria cucumerina),
ANTHRACNOSE (Colletotrichum lagenarium): Apply every 7 to
  14 days after disease appears.
  * Azoxystrobin
    Amistar, 3.5 to 5 oz. (1 day)
    Quadris, 11.0 to 15.4 fl oz. (1 day)
  Do not apply more than one foliar application of Amistar and
  Quadris or other strobilurin fungicide before alternating with a
  fungicide that has a different mode of action.

*Materials marked with an asterisk are particularly
recommended for problem infestations.

**Radishes**

Amount of chemical formulation to apply per acre (unless otherwise directed). Apply no closer to harvest than number of days given in parentheses. (RUP) = Restricted Use Pesticide. Consult bulletin E-959 for pictures of insects, life history and damage. See current Vegetable Crop Advisory Team Newsletter for up-to-date information on pest status and control. (Visit www.ipm.msu.edu/vegCAT.htm or use the order form in the back of the book to subscribe.)

**NEMATODES**

Root-knot nematodes can reduce radish yields. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). If the root-knot nematode is present at a population density above the economical threshold for radishes, crop rotation or application of a nematicide is recommended. The following nematicide is suitable for control of root-knot nematodes in radish production. Application is only needed before the first crop. The radish life cycle is shorter than...
that of the northern root-knot nematode and radishes serve as a
good trap crop for this nematode.

**FALL SOIL TREATMENT (BROADCAST):**
1,3-D
Telone II, 25 gal/A (muck soil).
Fumigate in the fall when soil temperatures at a 6 inch depth are
above 50°F. Inject the fumigant to soil depth of 6 inches and lightly
seal the soil immediately after application. Use soil fumigants only
as directed on the label. In some limited situations soil fumigants
can be applied in the spring in Michigan.
Correct soil moisture, temperature and soil structure is needed for
effective control of soil-borne pests. Special care is needed to seal
fumigants in target zone for required time periods. This can be
achieved by soil packing or by immediate tarping.

Commercial seed treatment plants only.

**PREPLANT INCORPORATED:**

**DAMPING OFF** (*Pythium* spp.):
- * Mefenoxam. Apply as a broadcast preplant incorporation or a surface application. For banded applications use a 7 in. band. Note: If natural rainfall is not expected before seeds germinate, incorporate mechanically before planting or water into the seed zone after planting with 1/2 to 1 in. of sprinkler irrigation.
  - Ridomil Gold GR, 20 to 40 lb.
  - Ridomil Gold WSP, 1 to 2 lb.
  - Ultra Flourish, 2 to 4 pt.

**FOLIAR TREATMENT:**

**LEAF ROT, BOTRYTIS GRAY MOLD** (*Botrytis cinerea*):
- Azoxystrobin
  - Quadris, 6 to 15.5 fl oz every 5 - 14 days. (0 days)
  - or DCNA
  - Botran 75 W, 1 1/3 lb (for greenhouse use only). (3 days)

NEMATODES
Squash are hosts for root-knot and lesion nematodes. These nematodes can reduce squash yields but yield losses in Michigan have not been documented. If you suspect nematodes are reducing squash yields collect root and soil samples for analysis as described in Appendix C. If the numbers of nematodes recovered from those samples exceed damage thresholds; control options will be suggested. Vydate 2L is labeled for use in squash.

INSECTS

SOIL TREATMENT:

CUCKUMBER BEETLE (STRIPED and SPOTTED), APHIDS, THRIPS:
* Imidacloprid
Admire Pro, 7.0 - 10.5 fl oz. (21 days)
or Nuprid 2 F, 16 to 24 oz. (21 days) Apply to soil in a narrow band 14 or less days before planting, as an in-furrow spray at planting, as a post-seeding drench, as a sidedress after plants are established or in drip or trickle irrigation water. Do not make more than 1 application per year. Cucumber beetle. Use on hard squash in areas with high beetle populations to control bacterial wilt disease.
or * Furadan 4 F, 2.4 oz/1000 ft of row. Apply at planting or transplanting in a 12- to 15-inch band, incorporate into the top 3 inches of soil or apply into the furrow and mix with the covering soil. (Special Michigan SLN label.) (RUP)

APHIDS, FLEA BEETLE, CUCUMBER BEETLE, LEAFHOPPER, THRIPS:
Platinum, 5 to 11 oz. (30 days) See label for application methods.

APHIDS, THRIPS, SQUASH BUG:
Venom, 5 to 6 oz. (21 days) See label for application methods.

FOLIAR TREATMENT:

Summer and winter squash plants may be sensitive to certain insecticide formulations. Make certain a problem exists before treatment. Read and observe restrictions on the label. To avoid killing bees, do not treat plants during bloom.

CUTWORM: Apply if >1% of plants are injured.

DISEASES
SEED TREATMENT:
DAMPING OFF (Pythium spp., Rhizoctonia solani):
Bacillus subtilis GB03
Kodiak, 0.1 to 0.5 oz/100 lb seed (Pythium).
or
Captan
Captan 30-DD, 1 2/3 oz/100 lb seed.
Captan 400, 1 1/2 to 2 oz/100 lb seed.
or
Fludioxonil
Maxim 4 FS, 0.08 to 0.16 fl oz/100 lb seed (Rhizoctonia).
Commercial seed treatment plants only.
or
Thiram
42-S Thiram, Thiram 50 WP Dyed, 4 1/2 oz/100 lb seed.

PRE-PLANT FUMIGATION:
PHYTOTHORA: Apply to production fields before planting.
Note: Most fumigants applied to the soil for control of disease organisms will also control soil insects, nematodes and weed seeds.

Soil sterilization by fumigation is best achieved by proper application of material. Correct soil moisture, temperature, and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or immediate tarping.

1,3 Dichloropropene/chloropicrin
Telone C35, 13-35 gal. (RUP)
or
Metam Sodium
Sectagon 42, Vapam HL, 37.5-75 gal.
or
Potassium N-methylidithiocarbamate
Sectagon-K54, 30-60 gal. Do not plant for 14 to 30 days after treatment (the wetter the soil, the longer the waiting period).

GREENHOUSE PREPLANT INCORPORATION:
DAMPING OFF (Pythium spp.), ROOT ROT (Rhizoctonia spp.):
Giociladium viriens GL-21
SoilGard 12 G, 1 to 1.5 lb per cubic yard. Biological control product that needs to be applied before disease development. Control may be limited under heavy disease pressure.

PREPLANT INCORPORATED:
DAMPING OFF and COTTONY LEAK (Pythium spp.):
* Mefenoxam. Apply as a broadcast preplant incorporation or a surface application. For banded applications use a 7 in. band.
Note: If natural rainfall is not expected before seeds germinate, incorporate mechanically before planting or water into the seed zone after planting with 1/2 to 1 in. of sprinkler irrigation.
Ridomil Gold WSP, 1 to 2 lb.
Ultra Flourish, 2 to 4 pt.

FOLIAR TREATMENT:
POWDERY MILDEW (Sphaerotheca fuliginea or Erysiphe cichoracearum): Treat at disease appearance.
* Myclobutanil
Rally 40 WSP, 2.5 to 5 oz, 7 to 10 day schedule. (0 days) Do not apply more than 1.5 lb per acre per crop.
or
* Pyraclostrobin
Cabrio, 12-16 oz. (0 days) Alternate one-to-one with fungicides having a different mode of action.
or
* Pyraclostrobin/Boscalid
Pristine, 12.5 to 18.5 oz. (0 days)
or
* Thiophanate-Methyl
Topsin 4.5 FL, 10 fl oz. (1 day)
Topsin 70 W, Topsin M WSB, 1/4 to 1/2 lb. (0 days)
or
* Trifloxystrobin
Flint, 1 1/2 to 2 oz, 7- to 14-day intervals. (0 days) Maximum 2 consecutive applications, 4 applications/year and 16 oz/season.
or
Azoxystrobin
Amistar, 3.5 to 5 oz. (1 day)

*Materials marked with an asterisk are particularly recommended for problem infestations.

Always read and follow label instructions carefully.
or
Quadris, 11.0 to 15.4 fl oz. (1 day)
Do not apply more than one foliar application of Amistar and Quadris or other strobilurin fungicide before alternating with a fungicide that has a different mode of action.

or
Azoxystrobin/Chlorothalonil
Quadris Opti, 3.2 pt every 7 - 14 days. (1 day)

or
Bacillus subtilis
Serenade, 6 to 8 lb every 7 days. (0 days) Biological control product that needs to be applied before disease development. Control will be limited under heavy disease pressure.

or
Serenade Max, 1 - 3 lb every 7 to 10 days. (0 days)

or
Chlorothalonil
Bravo Ultrex (1.8 to 2.7 lb) or Equus DF (1.8 to 2.7 lb (Sphaerotheca)) (0 days)

or
Bravo Weather Stik, or Echo 720 (2 to 3 pt, 7-day intervals)
or
Equus 720 SST (2 to 3 pt every 7 days) (0 days) Sphaerotheca.

or
Echo 90 DF, 1.6 to 2.4 lb every 7 days. (0 days)

or
Copper Ammonium Carbonate
Copper Count N, 1 to 2 qt. (0 days)

or
Triflumizole
Procure 50 WS, 4 to 8 oz every 7 - 14 days. (0 days)
or
Tebuconazole
Folicur 3.6F, 4-6 fl oz. (7 days) 12 hr REI.

SCAB (Cladosporium cucumerinum): Treat every 7 to 10 days after plants are 2 to 3 inches tall.

Chlorothalonil
Bravo Ultrex, Equus DF, 1.8 to 2.7 lb. (0 days)
Echo 90 DF, 1.6 to 2.4 lb every 7 days. (0 days)

or
Copper Ammonium Carbonate
Copper Count N, 2 to 3 qt. (0 days)
or
Neem Oil
Trilogy, 2 pt. (0 days)

ALTERNARIA LEAF SPOT (Alternaria cucumerina): Treat every 7 to 10 days when conditions favor disease.

* Azoxystrobin
Amistar, 3.5 to 5 oz. (1 day)
Quadris, 11.0 to 15.4 fl oz. (1 day)

Do not apply more than one foliar application of Amistar and Quadris or other strobilurin fungicide before alternating with a fungicide that has a different mode of action.

or
* Azoxystrobin/Chlorothalonil
Quadris Opti, 3.2 pt every 7 - 14 days. (1 day)

* Cyazofamid
  Ranman, 2.75 fl oz every 7 to 10 days.
  or Fosetyl-Aluminum
  Aliette WDG, 2 to 5 lb, 7- to 14-day intervals. (0 days) Do not tank mix with copper fungicides.
  or
* Mono-, dibasic sodium, potassium and ammonium phosphites
  Phostroil, 2.5 to 5 pt every 7 - 14 days. (0 days) Prophyl, 2 to 4 pt. (see label) or
* Mono-, dibasic sodium salts of phosphorous acid
  Fosphite, 1 to 3 qt per 20 gal (ground) or 10 gal (aerial) of water. (0 days)

*Note: Most fungicides applied to control downy mildew may have limited efficacy against Phytophthora crown and fruit rot.

Sweet Potatoes

Amount of chemical formulation to apply per acre (unless otherwise directed). Apply no closer to harvest than number or days given in parentheses. (RUP) = Restricted Use Pesticide. Consult bulletin E-959 for pictures of insects, life history and damage. See current Vegetable Crop Advisory Team Newsletter for up-to-date information on pest status and control. (Visit www.ipm.msu.edu/vegCAT.htm or use the order form in the back of the book to subscribe.)

NEMATODES

Root-lesion, root-knot and other nematodes are associated with sweet potato. If you believe you have a nematode problem associated with sweet potato production, a sample should be tested (see Appendix C). If plant-parasitic nematodes are present in population densities above estimated damage thresholds for sweet potatoes, management recommendations will be provided at that time. Vydate L and Mocap 15G are labeled for use on sweet potatoes for nematode control.

Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tarping.

(Visit www.ipm.msu.edu/vegCAT.htm or use the order form in the back of the book to subscribe.)

**NEMATODES**

Root-knot and root-lesion nematodes can reduce tomato yields. Fields with soil or root problems of undetermined cause should be tested for nematodes (see Appendix C). If the plant-parasitic nematodes are present in population densities above the economic threshold for tomatoes, crop rotation or application of a nematicide is recommended. The following nematicide is suitable for control of root-knot and root-lesion nematodes in tomato production.

1,3-D  
Telone II, 9-18 gal/A (mineral soil).
Fumigate in the fall when soil temperatures at a 6-inch depth are above 50F. Inject the fumigant to a soil depth of 6 to 8 inches and lightly seal the soil immediately after application. Use soil fumigants only as directed on the label. In some limited situations soil fumigants can be applied in the spring in Michigan.

Correct soil moisture, temperature and soil structure is needed for effective control of soil-borne pests. Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or by immediate tarping.

or  
Metam Sodium  
Vapam HL, 37.5 to 75 gal/A (use higher rate for muck soil).  
Inject with shanks spaced 5 inches apart or to a depth of 4 to 10 inches in well prepared soil. Follow immediately with a roller to smooth and compact surface. Light watering to the treated surface helps to prevent escape of gas.

**DISEASES**

**SEED (ROOT) TREATMENT:**

BLACK ROT, SCURF (Ceratostomella simbriata, Monilochaetes infuscans): Dip roots and sprouts in one of the following suspensions. Plant immediately.

DCNA  
Botran 75 W, 1 lb/7 1/2 gal water, dip for 10 to 15 seconds, drain and plant immediately.

or  
Thiabendazole  
Mertect 340, 53 1/2 oz per 50 gal of water (8 fl oz per 7 1/2 gal) dip for 1 to 2 minutes. Do not use treated roots for food or feed.

**PYTHIUM DAMPING OFF:**

Mefenoxam  
Apron XL, 0.085 - 0.64 fl oz/100 lb seed. (0 days)

**PREPLANT INCORPORATED:**

**DAMPING OFF** (Pythium and Phytophthora spp.):  
* Mefenoxam. Apply as a preplant incorporation or a surface application. For banded applications use a 7" band.

Note: If natural rainfalls not expected before seeds germinate, incorporate mechanically before planting or water into the seed zone after planting with 1/2 to 1" of sprinkler irrigation.

Ridomil Gold WSP, 1 to 2 lb.

**EARLY BLIGHT** (Alternaria solani):  
Pyrimethanil

DISEASES
SEED TREATMENT:
DAMPING OFF, PRE-EMERGENCE (Pythium spp., Rhizoctonia solani, Phytophthora spp.).
Gliocladium virens GL-21
SoilGard 12 G, 1 to 1.5 lb per cubic yard. Biological control product that needs to be applied before disease development. Control may be limited under heavy disease pressure.

GREENHOUSE SOIL DRENCH:
ROOT/STEM ROT (Rhizoctonia solani):
PCNB
Terraclor 400, see label for rates specific to soil depth.

PREPLANT SOIL FUMIGATION:
FUSARIUM WILT (Fusarium oxysporum), VERTICILLIUM WILT (Verticillium albo-atrum): Apply to production fields in the spring before planting. Note: Most fumigants applied in the soil for control of disease organisms will also control soil insects, nematodes and weed seeds.

Soil sterilization by fumigation is best achieved by proper application of material. Correct soil moisture, temperature, and soil structure is needed for effective control of soil-borne pests.

Special care is needed to seal fumigants in target zone for required time periods. This can be achieved by soil packing or immediate tarping.

Gliocladium virens GL-21
SoilGard 12 G, 1 to 1.5 lb per cubic yard. Biological control product that needs to be applied before disease development. Control may be limited under heavy disease pressure.

PREPLANT INCORPORATED:
DAMPING OFF (Pythium spp.):
* Mefenoxam. Apply as a broadcast preplant incorporation or a surface application. For banded applications use a 7 in. band.
Note: If natural rainfall is not expected before seeds germinate, incorporate mechanically before planting or water into the seed zone after planting with 1/2 to 1 in. of sprinkler irrigation.

Ridomil Gold GR, 20 lb.
Ridomil Gold SL, 1 pt. (7 days)
Ultra Flourish, 2 to 4 pt.

ROOT and FRUIT ROT (Pythium spp., Phytophthora spp.):
* Mefenoxam. Apply Ridomil 4 to 6 weeks after planting as a surface application or a soil surface spray under vines followed by 1/2 to 1 in. of water or injected based on a 7 in. band. A second application before the last irrigation may be made up to 4 weeks before harvest.

Ridomil Gold GR, 20 lb (4 weeks). (4 weeks) A third application can be made 4 weeks before harvest.
or

Thiram
42-S Thiram, Thiram 50 WP Dyed, 6 oz/100 lb seed. Apply to seed before planting.

Tebuconazole
Folicur 3.6F, 4-7.2 fl oz. (7 days) Maximum 28.8 fl oz/acre/season. 12 hr REI.
APPENDIX A
Seedbed Preparation

SEEDBED PREPARATION

Clean soil is necessary for good seedbed production. Organisms that cause damage to vegetable seedlings may be present in any soil or growing mixture. Soils may be sterilized by a number of chemical or physical techniques, such as steam or dry heat.

Warnings: All the listed fumigants may be used both in the seedbeds and to treat soils in which vegetables are grown to maturity, with the following exceptions: 1) METHYL BROMIDE and FORMALDEHYDE can be used only for seedbeds. 2) None of the materials can be used where living plants are growing. Carefully read the directions in the table below, and especially those of manufacturers, to avoid danger and to obtain successful results.

SEED TREATMENT

Dust method—place the seed and suggested wettable powders in a closed container and agitate vigorously for several minutes or until seed is coated with dust. For best results, use a container with twice the capacity of the seed treated.

Slurry method—to suggested wettable powders, add enough water to make a sloppy paste or slurry. Treat by stirring or swirling seed in the slurry until thoroughly coated. Dry the seed before planting. Slurries are preferred to dusts because they adhere to the seed better and are less irritating to use.

CHEMICALS SUGGESTED FOR SEEDBED STERILIZATION

CHLOROPICRIN
(E.G. CHLOR-O-PIC, PICFUME)

Warnings: Fumes are very irritating to eyes and are poisonous to growing plants. Wear full coverage protective clothing and a MSHA/NIOSH-approved respirator with the proper carbon filter.

Rate and Method of Application

Inject 1.6 to 2.3 cc of material 6 inches deep and at 8-inch intervals using a hand operated fumigation gun. Treat only when soil temperature 6 inches deep is above 65°F. Pack treated soil and apply water seal (wet to a depth of several inches) or cover with plastic for 48 hours. Cultivate to speed aeration and avoid planting for 2 weeks, or until odor of fumigant is no longer detectable.

FORMALDEHYDE

NOTE: Not effective for nematodes. Especially suited for cabbage and cauliflower.

Warnings: Fumes are irritating to eyes and nasal passages and poisonous to growing plants. Avoid prolonged contact with skin. Wash off with soap and water. Wear goggles, rubber footwear and rubber gloves when handling. Wear full coverage protective clothing and a MSHA/NIOSH-approved respirator with the proper carbon filter. Ventilate when treating a confined area. Rate of Method of Application

Mix 1 pt (37% to 40% strength) with 5 gallons of water and apply with a sprinkling can at the rate of 1/2 gal/sq ft of soil surface. Treat only if soil temperature 6 inches deep is above 60°F. Cover treated soil with a plastic cover. Leave undisturbed for 48 hours, then cultivate one or more times. Avoid planting for 2 weeks or until odor of fumigant is no longer detectable. Do not use near living plants. As a disinfectant for equipment and storage interiors or greenhouses, spray surfaces with a mixture of 1 pt (37% to 40% strength) in 5 gallons of water. Cover equipment with plastic and keep storage or greenhouse closed for 24 to 48 hours after treatment, then air out well before planting.

1,3-D (DICHLOROPROPENE; TELONE II)

Warnings: Fumes are irritating to eyes and nasal passages. Prolonged inhalation is dangerous; poisonous to growing plants. Avoid contact with skin. Wash off with soap and water. Wear goggles, rubber footwear and rubber gloves when handling. Wear full coverage protective clothing and a MSHA/NIOSH-approved respirator with the proper carbon filter.

Rate and Method of Application

Apply as a preplant broadcast treatment at least 14 to 21 days prior to planting. Late summer or early autumn is usually best for applying fumigants in Michigan. Inject at 8 inches deep with chisels spaced 10 to 12 inches apart when soil temperature is between 50° and 80°F. Seal immediately after application. If soil is waterlogged or temperature is below 60°F, allow additional time before planting. Use only on crops listed on the respective label.

1,3-D AND CHLOROPICRIN (E.G., TELONE C-17)

Warnings: Fumes are irritating to eyes and nasal passages. Prolonged inhalation is dangerous; poisonous to growing plants. Avoid contact with skin. Wash off with soap and water. Wear goggles, rubber footwear and rub-
ber gloves when handling. Wear full coverage protective clothing and a MSHA/NIOSH-approved respirator with the proper carbon filter.

**Rate and Method of Application**

Apply as a preplant broadcast treatment at least 14 to 21 days prior to planting. Late summer or early autumn is usually best for applying soil fumigants in Michigan. Inject 8 inches deep with chisels spaced 10 to 12 inches apart when soil temperature is between 50° and 80°F. Seal immediately after application. If soil is waterlogged or temperature is below 60°F, allow additional time before planting. Use only on crops listed on the respective label.

**SODIUM METHYL DITHIOCARBAMATE** (METHAM) (E.G., VAPAM OR VAPAM HL)

**Rate and Method of Application**

With a sprinkling can, fill with 1 to 1 1/2 pt metham and water and sprinkle uniformly over 50 sq ft of well-prepared soil. Sprinkle immediately with water until soil is sealed, or tarp for 48 hours. Seven days after treatment cultivate area to a depth of 2 inches to aerate soil. Do not seed earlier than 21 days after application if tarp is used. For soil injection, space injectors 5 inches apart and inject metham 4 inches into well-prepared soil. Follow immediately with a roller to smooth and compact the soil surface. Light watering or a tarp after rolling helps to prevent gas escape. For seedbeds, 75 to 100 gal/A (1 1/2 pt to 2 pt per 100 sq ft) is recommended.

**APPENDIX B**

**Nematodes and Michigan Vegetable Production**

George W. Bird, Professor
Michigan State University
East Lansing, MI 48824

Nematodes are believed to be the most common animals on our planet. They inhabit most soil, fresh water and marine environments. At least 12 types of nematodes are known to parasitize or cause infectious diseases of Michigan vegetable crops. Hundreds of other species are involved in making nutrients available for plant growth. The objectives of this article are to: 1) provide an overview of the nematode problems associated with vegetable production in Michigan, 2) discuss the management options for plant-parasitic nematodes, 3) describe how nematodes are involved in nitrogen mineralization and 4) provide some recommendations on how to enhance the role of nematodes in making nutrients available for plant growth.

The 12 types of plant parasitic nematodes that feed on vegetable crops in Michigan cause diverse symptoms, attack a wide variety of crops and have different behaviors.

**ROOT-KNOT NEMATODES**

Only one species, the Northern Root-Knot Nematode is known to over-winter under Michigan conditions. Other species can be brought into the state on transplants produced in the south.

**Crop Symptoms** - Root galls, yellowing, wilting, stunted top growth, stunted root growth, low crop yield and poor crop quality.

**Crops Attacked** - Beets, Broccoli, Brussels Sprouts, Cabbage, Carrots, Cauliflower, Celery, Cucumber, Eggplant, Garlic, Leeks, Lettuce, Melons, Onions, Parsnips, Peppers, Potatoes, Pumpkins, Squash, Tomatoes.

**Nematode Behavior** - Second-stage juveniles invade root tissue a short distance behind the root tip. They migrate towards the root tip, stop, turn and then migrate to where the vascular cylinder is being formed. Here, the plant forms nurse cells for use by the nematodes for their
growth and development. The plant also forms root galls for protection of the hundreds of eggs in each egg mass. Extensive amounts of plant matter and energy are used in this process, resulting in unsatisfactory crop growth and development. A close relative, the False Root-Knot Nematode, has been found associated with sugar beets in Michigan and has the potential to feed on beets and potato. This species, however, has not been detected in Michigan during the last 25 years.

**CYST NEMATODES**

Michigan is the home to nine different species of cyst nematodes. Three of them, Carrot Cyst Nematode, Soybean Cyst Nematode and Sugar Beet Cyst Nematode can be serious problems in Michigan vegetable production.

**Crop Symptoms** - Yellowing, stunted top growth, stunted root growth, poor nodulation, pinhead size white females on root tissue, poor crop yield and poor crop quality.

**Crops Attacked** - Carrot Cyst Nematode (carrots), Soybean Cyst Nematode (Snap Beans, Peas) and Sugar Beet Cyst Nematode (Beets, Broccoli, Brussels Sprouts, Cabbage).

**Nematode Behavior** - Second-stage juveniles invade root tissue about one half of an inch behind the root tip. They burrow to where the vascular cylinder is being formed and induce the plant to form nurse cells for nematode feeding. The female swells and breaks through the root tissue. When she has filled her body with eggs, she dies and drops from the root. Her body hardens to become a protective cyst that can survive in soil in the absence of a host for up to 12 years. Extensive amounts of plant matter and energy are used in this process, resulting in poor crop growth and development.

**ROOT-LESION NEMATODES**

The Penetrans Root-Lesion Nematode is the most common plant parasitic nematode in Michigan and feeds on the root systems of many crops. A second nematode, the False Root-Lesion Nematode causes damage to mint grown in muck soil.

**Crop Symptoms** - Yellowing, stunted top growth, stunted root growth, root lesions, poor crop yield and poor crop quality.

**Crops Attacked** - Beets, Broccoli, Brussels Sprouts, Cabbage, Carrots, Cauliflower, Celery, Corn, Cucumber, Eggplant, Garlic, Leeks, Lettuce, Melons, Mint, Onions, Parsnips, Peppers, Potatoes, Pumpkins, Squash, and Tomatoes.

**Nematode Behavior** - All stages of root-lesion nematodes are mobile and penetrate root tissue as endoparasites. After root penetration, the nematodes migrate throughout the root cortex, where females deposit their eggs. This migration, combined with chemical exudates, results in reduced uptake and transport of water and nutrients throughout the plant. Root-lesion nematodes are known to interact with soil-borne fungi to cause disease complexes. The best known of these is the Potato Early-Die Disease Complex.

**NEEDLE NEMATODES**

There are two types of Needle Nematodes in Michigan, the Common Needle Nematode and the Corn Needle Nematode. They can exist in both muck and mineral soil.

**Crop Symptoms** - Greatly stunted top growth, barren areas, swollen root-tips, reduced crop yield and poor crop quality.

**Crops Attacked** - Celery, Corn, Garlic, Onions.

**Nematode Behavior** - Needle nematodes are large ectoparasites and only the nematodes’ stylets penetrate root tissue. The Corn Needle Nematode feeds early in the growing season and then migrates deep into the soil. Its distribution is limited to very coarse textured sandy soils. The Corn Needle Nematode has a narrow host range and can easily be managed through crop rotation. Needle nematodes have the ability to vector viruses.

**BULB AND STEM NEMATODES**

Bulb and Stem Nematodes feed on shoot and not root tissue. There are two very different species associated with Michigan vegetable production systems. One attacks onion and celery, and the other feeds in potato tubers. Both are rarely detected in vegetable fields in Michigan.

**Crop Symptoms** - Yellowing, stunted top growth, a highly characteristic odor, bloated leaves and bulbs or tuber rot, reduced yields and unsatisfactory crop quality.

**Crops Attacked** - Onions, Garlic and Potato.

**Nematode Behavior** - The Bulb and Stem Nematode is a migratory endoparasite of shoot tissue. Fourth-stage juveniles penetrate onion tissue at the junction of the root and shoot system. They migrate through leaf and bulb tissue resulting in greatly deformed growth.

**PIN NEMATODES**

There are two types of Pin Nematodes associated with Michigan vegetable production, one limited to muck vegetable production and the other associated with mineral soil production systems. Crop Symptoms - Stunted top growth, no feeder roots (witches-broom), reduced yield.

**Crops Attacked** - Carrots, Celery and Corn.

**Nematode Behavior** - Pin Nematodes are small ecotoparasites that feed only from the outside of root tissue. These nematodes have a long stylet that can be inserted into the central vascular system of roots.
STUBBY-ROOT NEMATODES

Although several species of Stubby-Root Nematodes are known to exist in Michigan, they have not been detected as often recently as in the past. Crop Symptoms - Yellowing, stunted tops, stubby roots and poor yields. Crops Attacked -Corn and Onions. Nematode Behavior - Stubby-Root Nematodes are small ectoparasites. They feed close to the root-tip and prevent cell division and root elongation.

MANAGEMENT OF PLANT PARASITIC NEMATODES IN MICHIGAN VEGETABLE PRODUCTION

The first part of any pest management program is proper identification of the problem. While the cause of some nematode problems can be confirmed under field conditions, a laboratory analysis is usually needed. Michigan growers are encouraged to submit soil and plant tissue samples to MSU Diagnostic Services for confirmation of the cause of an existing problem or information for use in program avoidance. MSU has two Nematode Diagnosticians responsible for nematode analyses. Additional details about this service can be obtained by contacting www.cips.msu.edu/diagnostics or the County Office of MSU Extension.

As with all pest issues, problem avoidance is always the first-line defense and best strategy. This can be achieved by growing or purchasing high-quality nematode-free transplants or propagation material. Most of the other tactics related to problem avoidance or exclusion are based on common sense. For example, a field with a documented nematode infestation should not be worked immediately before moving equipment to a high quality nematode-free site. With proper planning, it is often possible to isolate or contain a nematode problem to a single field without infesting the rest of the farm. When this fails, control or nematode population reduction is usually required. In many cases this is expensive and results in a significant reduction in potential profits.

Once a Michigan vegetable production site is infested, crop rotation is the first control tactic that should be considered. For example, corn and wheat are not hosts for the Northern Root-Knot Nematode and can be used to reduce population densities of this species below its damage threshold. Crop rotation with agronomic crops is the main reason that current Michigan mineral soil carrot producers have very few nematode problems. In general, muck soil carrot growers have not had this option and have had to contend with serious nematode problems. Although the only known host in Michigan for the Carrot Cyst Nematode is carrots, this species can survive for up to a decade in the absence of a host, making the use of crop rotation impractical. Corn Needle Nematode problems can be resolved with a year or two of a non-host crop. Cover, trap and green manure crops that produce decomposition chemicals with nematicidal properties have been used in Michigan vegetable production. Cover crops, however, are variety specific in relation to their suitability for use in nematode management systems. For example, Adagio or Colonel oil seed radish are excellent trap crops for control of the sugar beet cyst nematode, but are good hosts of the Northern Root-Knot and Root-Lesion nematodes. Because of this complexity, it is often necessary to interact with a consultant or MSU Diagnostic Services for assistance in designing of the best possible nematode management program.

Nematode population reduction can also be achieved through the use of nematicides. There are basically two types, fumigant and non-fumigant nematicides. Telone II and metham are the most commonly used soil fumigants in Michigan vegetable production. Telone II must be injected into the soil; whereas, metham (Vapam and others) can be injected or applied as a chemigant in irrigation water. Methyl bromide, Telone C-17, Telone C-35 and chloropicrin can also be used under special circumstances. The non-fumigant options are organophosphates or organocarbamates. Vydate, Nemacur, Mocap, Counter and Furadan are the most commonly used non-fumigant nematicides. These materials are all very different in relation to the best methods of application and suitability for specific nematode species. Information about the use of nematicides is present in this MSU Extension Bulletin (E-312).

ROLE OF NEMATODES IN NITROGEN MINERALIZATION

Plants take-up inorganic forms of nitrogen from soil for use in their growth and development. While we often think that the fertilizers applied serves this role, the situation is often more indirect and complex. Fertilizers often feed microbes and subsequently the microbes feed the plants. Bacterial and fungal feeding nematodes play important roles in this process. For example, plant root-exudates or decomposing organic matter serve as food for bacteria. The bacteria serve as food for bacterial feeding nematodes which receive excess organic nitrogen from this process. The excess nitrogen is transformed into an inorganic form and excreted from the nematode into the area immediately adjacent to the root surface when it is taken-up by the plant for use in the growth and development process. It is important to maintain high population densities of bacterial and fungal feeding nematodes. Most of these species have relatively short life cycles (72 hours); whereas, life cycles of plant-parasitic nematode range from 30 days to two years, with the exception of the cysts which may remain viable in the absence of a host for up to 12 years.
NEMATODES AND SOIL QUALITY

Soil quality can be defined as the ability of a soil to resist degradation and respond to management. Soils with nematode problems are not high quality soils. Anything that can be done to increase quality soil organic matter (SOM) will decrease risk to plant parasitic nematodes and enhance soil quality. What is quality organic matter? Quality SOM is composed of active soil carbon and active soil nitrogen. The term active refers to the ability of the SOM to mineralize soil carbon and soil nitrogen, respectively. Much of this is done by microbes and soil fauna such as bacterial and fungal feeding nematodes. The best way to create an appropriate environment for these organisms and their essential functions is to maintain a diversity of plants and organic amendments in the system. Mixtures of grass and legume cover crops supplemented with manure or compost can be used to create a biologically active soil that is highly productive and devoid of problems caused by plant parasitic nematodes. Do not hesitate to contact me at birdg@msu.edu or (517) 353-3890 if you have any questions about nematodes and their relationship to soil quality. The MSU Nematode Diagnosticians, Fred Warner (517-432-1333) and Angela Tenney (517-353-8563) are available to provide information about management of plant-parasitic nematodes.

Appendix C
Detecting and Avoiding Nematode Problems

Plant-parasitic nematodes are microscopic roundworms that live in soil and feed on roots or foliage of economically important plants. Nematode feeding can result in diseased plants with symptoms such as stunting, yellowing, wilting, yield reduction, root galling and the formation of root lesions. Although damage from plant parasitic nematodes costs Michigan vegetable growers millions of dollars annually, many of these losses are never correctly diagnosed. This appendix provides instructions for the nematode detection methods necessary to avoid or diagnose nematode problems.

A laboratory analysis of soil and root or shoot system tissue is usually necessary for diagnosis or long-term avoidance of plant-parasitic nematode problems. In Michigan, this service is provided by the Michigan State University Nematode Laboratory within Diagnostic Services. There are also private sector laboratories that provide nematode detection services. A $25 fee is charged by MSU for analyzing each combined soil and root sample.

Samples for nematode analysis should be forwarded to:
Diagnostic Services
101 CIPS
Michigan State University
East Lansing, MI 48824-1311

Samples taken directly to MSU should be delivered to Room 101 in the Center for Integrated Plant Systems (formerly the Pesticide Research Center). All samples must be submitted with a completed sample information form. These forms are available at county MSU Extension offices or can be downloaded from the Diagnostic Services web site at www.pestid.msu.edu.

Sample objective

The results from the samples are used to decide how to deal with nematode problems and how to avoid problems.

Diagnosing problems

When plants exhibit symptoms such as stunting, yellowing, wilting, early-die, yield reduction, root-galling, root-lesions or plant mortality that cannot be attributed to other causes, take samples of appropriate soil, root system, or shoot systems, and submit them for nematode analysis.

Avoiding nematode problems

Generally soil from Michigan agricultural sites should be analyzed for nematodes every 3-5 years at the minimum. If nematodes are a major limiting factor in the production of particular crops (e.g. northern root-knot nematodes on carrot), sites should be sampled every fall or spring prior to the growing of these crops. The test results are used to make decisions for avoiding nematode problems.

When to sample

Generally, soil and root samples can be taken, submitted and reliably processed whenever the soil is not frozen. For the best possible results, however, do not take samples until 45 days after annual root growth, and not...
after the soil is frozen in late fall or winter. When considering fall soil fumigation, collect and submit samples between August and November. To determine if non-fumigant nematocide use is warranted, sample between March and May.

**How to sample**

**Sampling instrument:** Take samples with a soil sampling tube, trowel, or narrow-bladed shovel at a 2-to-12-inch depth. Include as many feeder roots as possible.

Feeder roots or shoot tissue must always be included for samples submitted for best assessing the population densities of endoparasitic nematodes.

**Sample size:** Each sample should consist of a pint to a quart of soil taken from a larger sample composed of 10 or more subsamples. The number of samples needed depends on the size, history, and uniform soil texture of the area being investigated.

- Small area (less than 5,000 sq. ft.), take at least 10 subsamples (soil cores or borings).
- Medium area (5,000 sq. ft. to 1 acre), take at least 25 subsamples.
- Large area (1 to 80 acres), take at least 50 subsamples. In Michigan, no one sample should represent more than 80 acres, and each sample should be from an area of uniform soil texture.

The sampling pattern depends on the commodity and field history. Mix subsamples in a clean pail or a plastic bag and submit one pint to a quart for nematode analysis.

Subsamples from problem area: Plant-parasitic nematodes feed only on living tissues and are rarely found in dead roots. Therefore, take samples from the margin of the problem areas where the plants are still living.

**Sampling container:** A plastic bag can be used for nematode samples. Place samples in plastic bags as soon as possible. Nematodes will be killed if the sample is allowed to dry, and it is important that nematodes are living when the sample arrives at the laboratory.

**Sample storage:** Soil and root samples should be regarded as perishable. Handle accordingly, and process as quickly as possible. Ideally, they should be stored at 10-15°C (50-58°F). Do not expose them to direct sunlight or store them in hot areas, such as the trunk of your car. Temperatures greater than 40°C (100°F) will kill nematodes.

**How to submit samples**

Samples are usually submitted to the MSU Nematode Laboratory through the local extension office, accompanied by a completed form. The information required on the form is essential for diagnosing nematode problems and proper recommendations for nematode population management.

It generally takes two weeks from the time a sample is taken until the results are returned to the grower. The results may be returned through the local extension agent, a private consultant, or directly. The rapid root and soil assays used for mineral soils, however, are not always satisfactory for analysis of organic soils. In a few cases, a bioassay that requires a 45-day incubation period is used to analyze organic soils. When this procedure is recommended, the grower will be immediately notified of the delay and will receive the results within two months after the sample was received.

**Results and recommendations**

The types and numbers of nematodes will be recorded on the assay form along with an indication of whether or not nematodes are a problem. If nematodes appear to be a problem, you will be occasionally referred to an appropriate extension bulletin for a recommendation. The recommendation should be discussed in detail with the local extension agent or private consultant.
How to submit a sample to MSU Diagnostic Services

Sample Submission

Accurate diagnosis depends on the rapid receipt of fresh and representative samples along with pertinent information relating to the problem. A completed submittal form should accompany all samples. Submittal forms are available at MSU Diagnostic Services or your local Extension office. Submittal forms can also be downloaded from www.pestid.msu.edu. Samples can be dropped off at our reception area between 8 a.m. and 5 p.m. or shipped overnight delivery by U.S. mail, FedEx, or UPS. To preserve the quality of the sample, do not package samples in envelopes. Also avoid mailing samples on Friday.

Submit samples to:
Michigan State University
Diagnostic Services
101 Center for Integrated Plant Systems
East Lansing, MI 48824-1311
Phone: (517) 355-4536 Fax: (517) 432-0899

Plant Health Analysis Samples:

Herbaceous Plants: Send whole plants, including roots and soil. Roots and soil should be in a plastic bag tied off at the soil line to prevent soil from touching foliage.

Tree Decline/Wilt: Send 6 to 12 branch sections .5 inch to 1 inch diameter and ~ 8 inches long. Samples should be taken from live areas of tree with symptoms, not from completely dead branches. Seal branches in plastic to retain moisture.

Seedlings: Leave plants in plug sheets or trays if possible. Send a minimum of 12 seedlings.

Turf: Include a 6” square of turf from the margin of the diseased area so that both healthy and diseased turf is included. An intact layer of soil should be included. Wrap sample in newspaper and pack in a box for shipment. Include a detailed description of cultural practices. Do not add moisture to the turf prior to shipment.

Leaf spot and Fruit Rot: Send several affected samples representing the early and moderate stages of the symptom progression.

Herbicide Injury: Submit both injured and apparently healthy crop plants. Plants should be dug carefully from the soil so roots, if injured, will remain intact. Roots and soil should be placed in a plastic bag, pot, or small bucket to prevent soil from touching the foliage. A pint of soil from both “good” and “bad” area should also be submitted. Any patterns in the field should be noted on the submittal form, along with past crop and pesticide history.

Weed/Plant Samples:

Herbaceous Plant Identification: Submit whole plants, including roots, vegetative structures, and flowers. Plants may be pressed flat between paper or cardboard to prevent leaf crinkling. For best results, plants should be submitted immediately after digging. Roots and soil should be in a plastic bag to prevent soil from touching the foliage.

Woody Plant Identification: Submit a large section of the terminal end of the stem or branch. Where possible, include any flower or fruiting structures, roots, and leaves. Leaves may be pressed flat between paper or cardboard to prevent crinkling. Woody plants may be wrapped in plastic to retain moisture.

Herbicide Resistance: Weeds will be screened for herbicide resistance using one of several techniques. Typically, a whole plant pot assay established from seed will be our standard test for resistance confirmation. Mature, high quality seed or seedheads should be collected from suspicious plants in late summer or fall and submitted in a paper bag. Do not seal in plastic. Screens will be designed by herbicide site of action (ie: ACCCase inhibitors, ALS inhibitors, Photosynthesis inhibitors). Other resistance confirmation tests may be utilized but will depend upon weed species, herbicide, and mechanism of resistance. Extensive tests include but are not limited to: petri-dish germination, chlorophyll fluorescence, leaf disc flotation, and enzyme sensitivity assays, as well as molecular diagnostic testing.
How to submit a sample to MSU Diagnostic Services (continued)

Nematode Samples:
Refer to MSU Extension Bulletin E-2199, “Detecting and Avoiding Nematode Problems.”
Always store nematode samples in plastic bags or other containers that retain moisture. Submit a pint to a quart of soil.

Problem Diagnosis: Collect soil & roots (or foliage) from the margins of diseased areas. Submit samples of diseased plants and apparently healthy ones.

Problem Avoidance: Collect soil & roots (if available) by walking a zigzag or w-shaped pattern. The more subsamples (soil, cores, probes, etc.) collected the “better” the sample.

Insect/Arthropod Samples:
Precise identification of insects or other arthropods requires specimens to be undamaged upon arrival. It is very important to kill and ship the specimens in a manner that will not damage the delicate structures that facilitate their identification. Dried and unprotected insects crumble easily during mail processing. Kill and ship specimens in a small, leak proof vial filled with rubbing alcohol.

Moths/Butterflies: Place specimens in the freezer for half an hour to kill them and gently pack in a small box or vial with tissue paper.

Ants/Other Adult Arthropods: Ant specimens should only include worker ants (i.e. those without wings). Submit all specimens in alcohol. Other adult and hard-bodied specimens: Submit in alcohol.

Larvae (Caterpillar, grub, maggot, etc.): Whenever possible, soft-bodied larvae should be lightly boiled for a few minutes before placing them in alcohol. This prevents the specimens from shriveling and becoming discolored, however it only works if the larvae are alive when dropped in the boiling water.

Pesticide Analysis Samples:
Soil, water, and plant vegetation can be tested for the presence of pesticides using appropriate analytical instruments and techniques. Pesticides will be tested on an individual basis or, if available, in multi-pesticide screens. Samples should be submitted in leak-proof, glass containers and kept cold or frozen until arrival.
