MICHIGAN CORN PRODUCTION

HYBRIDS COMPARED 1994

By: Keith Dysinger, Mervin Chamberlain, Dale D. Harpstead, James Lempke*, and Michael Allen, and David Main**

Hybrid corn trials are conducted each year by the Department of Crop and Soil Sciences, Michigan Agricultural Experiment Station, in cooperation with MSU Extension, seed corn companies, and farmers.

Many hybrids are offered for sale in Michigan. They differ in yield capacity, maturity, lodging resistance, and other characteristics. Choosing the best corn hybrids is an important part of profitable corn production. By planting the hybrids best suited to the individual farm location, a grower can obtain higher yields with little or no increase in total production costs. Seed of hybrids with the best performance records in Michigan will generally cost no more than seed of hybrids with lower performance ratings.

The highest yielding hybrids in the 1993 trials produced 30 bushels more per acre than the average of 498 hybrids tested (Table A) and 67 bushels more than the lowest yielding hybrids. Eleven trial locations containing 20 tests were harvested for grain yield. Average yield of all hybrids grown in Zone I was 170, Zone II was 174, Zone III was 150, and Zone IV was 92. The average moisture for the early maturity hybrid

Average-All Zones			158	188	121	26	33	20	1.9	9	0

group was 6 percent less than the late hybrids in Zone I and Zone II and 5 percent in Zone III. Stalk breakage averaged 9 percent for the hybrids with the highest amount of stalk lodging, 1.9 percent for the average and 0 percent for the lowest (Table A).

Entries

All seed companies are invited to enter hybrids in the trials each year. A fee is charged to cover some of the direct expenses.

Table 24 presents a list of all hybrids planted in the 1993 trials. At the 13 locations, 297 hybrids from 38 seed companies were tested for either grain or silage as 1569 entries. Company names used in association with hybrid numbers refer to the brand. The numbers are the companies' designations.

Methods

Three locations are identified in each of four maturity zones. These zones are based on growing degree-days established from long-term weather records. Hybrids to be tested in each zone are entered in all locations representing that zone. Hybrids tested at each location are assembled into an early and late group according to maturity ratings provided by the seed companies.

Two-row plots are used. Plots are 22 feet long with a 30-inch row spacing. At most locations planting rates are set at 28,300 seeds per acre and thinned to 27,700 plants per acre at the 12-18 inch stage of plant height. High yielding-irrigated plots in Cass and Montcalm counties were planted at 31,000 and thinned to 30,800. The remaining trials in Mason County and all zone IV trials are

planted at 26,400 but thinned back to 24,500 plants per acre. A three-replication, triple-lattice design is used throughout the testing program.

All hybrids were grown under similar conditions at each location. They are grown in farmers' fields with equal fertilizer, population, date of planting, and other management practices. Trials in Cass, Montcalm, and Mason counties were irrigated.

From seed packaging through harvest and data processing, each hybrid is identified only by a code number to assure that an unbiased estimate is made of each hybrid's potential. The code is deciphered after the data have been processed.

Stand are counted and thinned in June and July prior to tasseling. Lodging measurements are made at harvest counting all plants broken below the ear. Plots are harvested mechanically for both grain and silage. Moisture content and field weight were determined from shelled grain samples collected in automated test equipment mounted on a plot picker-sheller. Grain yields are reported at a standard 15.5 percent moisture. Silage yield estimates are based on an air-dried sample. Further evaluation by means of an in-vitro silage digestibility analysis was conducted by the Department of Animal Science.

Growing Conditions

All yield trials were planted between May 1 and May 17. Planting was timely. The monthly weather data for each test location is shown in Table B. The 1993 growing season was significantly warmer than the 1992 season but was still below long-term growing degree day averages at 8 of the 12 test locations.

Closer inspection reveals that all locations except Monroe were cooler than normal during May and June. Early growth of corn was delayed and this delay may have been associated widespread reports of herbicide damage. Warmer than normal temperatures in July and August fortunately were complemented by adequate rainfall.

September was cooler than normal. While most corn hybrids reached maturity, dry down was delayed in many locations.

Harvest was completed between October 14 and November 12. In 1993 Michigan farmers grew an estimated 2,200,000 acres of corn for grain with a state average of 110 bushels. Silage acreage was estimated at 330,000 acres with yields averaging about 8 tons per acre.

Silage

Six locations containing 9 tests were harvested for silage. Menominee County was harvested as silage in 1993. With late maturing corn, it was again determined to be the better option for yield results similar to 1992.

Trials conducted in Kent, Ingham, and Huron counties contain two maturity groups with yield data presented in Tables 17, 18, 19, and 20. Additional silage trials were conducted in Alpena and Missaukee counties in 1993, Tables 21, 22, and 23. The results obtained from the 1993 silage digestibility trials are also presented in these same tables. This is the third year that digestibility analyses have been made.

Chopped silage (fodder plus grain) samples were weighed. A representative sample collected for use in determining moisture content (air dried) was finely ground with sub samples taken for in-vitro analyses.

Results of four analyses are presented. They are:

1. **DMD=Dry matter digestibility.** This is a measure of energy available from the corn forage. The higher the DMD, the greater the energy content. It is determined by a laboratory method which incubates a sample of the corn forage with microbes from the rumen of a cow. Thirty hours is used to represent the average retention time of feed in the rumen. Differences among hybrids in DMD are approximately equal to differences in total digestible nutrients or TDN. A high DMD is desirable.

2. **FD=Fiber digestibility.** This is a measure of the degree of fermentation of fiber by ruminant animals. It is determined as the disappearance of neutral detergent fiber during an in vitro rumen fermentation. High fiber digestibility has

been found to increase intake of ruminants as it decreases the filling effect of the feed and provides energy to microbes in the rumen increasing microbial protein production. A high FD is desirable.

3. **NDF=Neutral detergent fiber.** This is a measure of the fiber content of the corn forage. Fiber must be fermented by microbes in the gastrointestinal tract to be utilized by ruminants. It is much less digestible than non-fiber constituents of the forage. Forages with high levels of NDF have lower energy. It is also a measure of the gut filling properties of the forage and high NDF decreases forage intake. A low NDF content is desirable.

4. **CP=Crude protein.** Forages are generally supplemented with high protein concentrates such as soybean meal to increase the protein content of ruminant diets. Corn hybrids with high protein require less supplementation and therefore lower feed costs. A high protein content is desirable.

*All analyses were determined by wet-chemical methods.

How to Use This Bulletin

One-, two-, and three-year averages are presented for all hybrids tested during 1993, 1992, and 1991 wherever the data are available. One-year results are less reliable than two- or three-year averages and should be interpreted with more caution. Confidence in corn performance data increases with the number of years and locations of testing.

Yields averaged from the three-location entry system have been included. Tables 4, 8, 12, and 16 report the average measurements made on entries within a maturity zone.

The tables report the following information about the hybrids tested:

1. Average moisture content at harvest.
2. Average yield (in bushels) of shelled corn at 15.5 percent moisture.
3. Average percent of stalk lodging (plants broken below the ear at harvest).

TEMP = Temperature(°F)

PPT = Precipitation (inches)

GDD = Growing Degree Days calculated at base 50°F, with 50°F and 86°F cutoffs

OBS = Totals observed in 1993

NORM = Normals calculated over 30 year period (1951-1980)

DEV = Deviation of observed from normal

Data provided by: MSU-AGRICULTURAL METEOROLOGY OFFICE

Jeff Andresen and Tom Cate

Stalk breakage can be caused by corn borers and/or stalk rot diseases.

Hybrids are recorded in the tables in order of their approximate maturity in the current growing season (early to late), based on moisture at harvest.

Two or more plots of the same hybrid in the same field may produce somewhat different results because of uncontrolled variability in the soil and other environmental factors. Replication and randomization of the entries are two methods used to reduce these errors. Because these methods do not eliminate all of these variables, the magnitude of difference necessary for statistical significance has been calculated for yield and moisture content. The value calculated as the "least significant difference" or "LSD" is the amount that an individual hybrid would have to differ from the experiment average to be significantly different from that average.

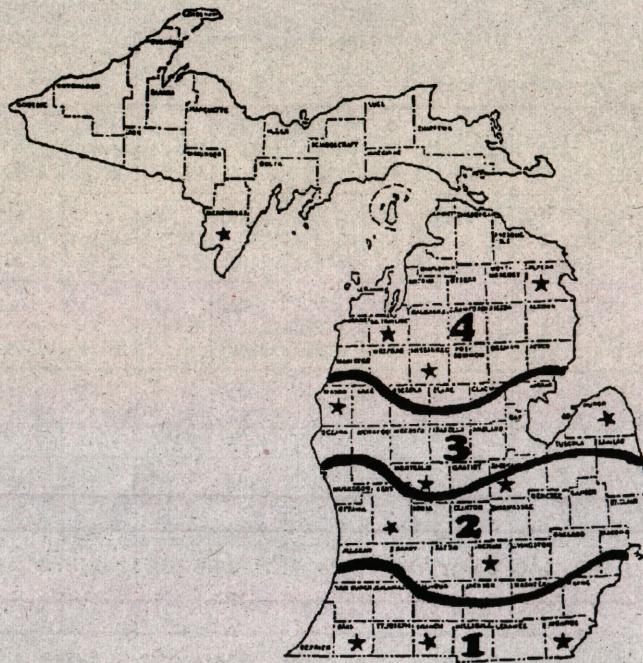

Hybrids with yields significantly better than the average grain yield at each location are marked with an asterisk (*) in each table. Other agronomic information relative to each trial is given at the bottom of the table. Fertilizer amounts are shown as total pounds per acre of nitrogen, P₂O₅ and K₂O applied during the season.

How to Choose a Hybrid

Adaptation

The following map shows the locations of the trials, and it divides Michigan into four generalized maturity zones. Local variations in weather, soil type and fertility, time of planting, and other conditions all affect adaptation. Corn hybrids are often adapted to more than one zone.

Find the zone in which you plan to grow the corn, and refer to the table that gives results for the trials conducted nearest to you. Also, refer to the table of averages listed for your zone. A hybrid that has done well at two or more locations is more likely to be a good hybrid for your farm, also.

Planting Rate

The number of seeds sown per acre in Michigan has increased steadily over the past several years. Increased planting rates are not a guarantee of increased yields. High plant populations (28,000 or more per acre) should be considered only for fields consistently producing more than 125 bushels per acre. With high plant populations, rainfall deficiencies and other growing season stresses frequently result in no increase in yield and may actually result in decreased yield compared with a more modest plant population of approximately 24,000 plants per acre. Lodging and harvest losses are often greater at higher populations.

Maturity

Hybrids are listed in the tables in order of maturity (early to late), based on moisture content of the grain at harvest. This is usually a reasonably accurate measure of relative maturity in most years in Michigan. Early-maturing hybrids are generally lower in moisture content than later-

maturing hybrids. Differences among hybrids in rate of drying in the field also affect moisture content at harvest but usually do not greatly disturb the relative maturity ratings as determined by moisture content.

One percent more moisture at harvest reflects a delay in maturity of about two days. Corn is considered to be mature when a black layer of cells forms at the base of the kernel. At this time, kernel moisture will be between 32 and 35 percent.

For Grain

It is better to choose an early hybrid (below average moisture content) than a late hybrid for grain. Data in the tables show that good yields do not totally depend on later maturity. On the average early maturing hybrids in 1993 produced about five bushels per acre less than the later maturing group. The cost of drying the 5-6 percent increased harvest moisture of the later maturity hybrids more than off-set the value of the yield gains. Advantages of early-maturing hybrids are:

- They usually mature before killing frosts.
- Adapted early hybrids generally yield as much or more than late hybrids in most areas of Michigan.
- Early hybrids with lower moisture content at harvest reduce drying costs and market discounts for moisture.
- Mature, dry corn makes better livestock feed.
- Harvest can take place earlier in the fall when weather conditions are most favorable. Early harvest may reduce corn losses resulting from broken stalks and dropped ears.
- Fall tillage of corn stubble may be possible with early hybrids on land not subject to erosion.

For Silage

A good rule of thumb for selecting a superior silage hybrid is to choose one that also has the potential for high grain production. High dry-weight production per acre is a better reason for choosing hybrids for silage than tons of green weight.

Corn for silage should reach the early dent stage well before frost in an average year. The early dent stage (when most of the kernels have dented) is the best time to begin silage harvest. Dry matter production continues to increase until maturity.

Other Considerations

Choose early hybrids for late plantings, low soil fertility, sandy and muck soils, and for corn that it is to be followed by a winter grain or cover crop. Experience has shown that when corn is grown under no-till operations a significant advantage results from the use of earlier maturity hybrids.

Some degree of "crop insurance" can be obtained by choosing two or three hybrids that differ slightly in their maturity. If one hybrid encounters unfavorable weather at a critical growth stage, another may be less affected and produce a good crop.

Even though you have been growing a hybrid that has given good results, you may be able to improve your average corn production by trying one or more hybrids with better records in these trials. Well tested new hybrids are worth consideration. It may be advisable to try a new hybrid in a strip in the same field with your present hybrid.

Ways to Reduce Stalk Lodging

Several stalk-rotting fungi may cause broken stalks at harvest and create a major problem in corn production. Stalk rot occurs when fungi increase rapidly after the plant has matured or when the plant dies prematurely. The highest incidence of stalk rot occurs in years when corn matures early and harvest is delayed. Infection and disease development are favored by warm, humid weather and abundant rainfall during the latter part of the growing season.

Hybrid resistance to stalk rot is only one of several factors that determine the extent of stalk breakage. There are no clear-cut cases of specific hybrids that can consistently be depended upon to resist stalk rot under all conditions of soil fertility, plant population, plant stress, and maturity. A major part of the difference in resistance to lodging appears to be mechanical—stiffer stalks do not break as soon when disease attacks.

The most effective practice to reduce losses from stalk rot is to harvest as soon as possible after maturity. Stalk breakage continues to increase rapidly when harvest is delayed. Early hybrids that mature in September will have more stalk breakage than late-maturing hybrids if harvest occurs in November and December.

There may be little or no advantage to planting the early-maturing hybrids if harvest is delayed.

To avoid problems, choose high-yielding, early-maturing hybrids, plant early and harvest early.

Ways to Avoid Moldy Corn in 1994

- Plant early.
- Plant early- to medium-maturing hybrids.
- Harvest early—during October. Weather problems and harvest losses increase with later harvest.
- Plan for adequate artificial drying. Drying in the field or in the crib is slow and undependable in Michigan. Ready access to drying facilities will permit more timely harvest and prevent high pre-harvest loss, a major factor in reduced corn profits.

Seed Supplies for 1994

Most corn seed production operations did not experience unusual production problems in 1993. Seed quality can be expected to be good for most hybrid combinations. A higher than normal demand is expected to continue for early and mid-season maturity hybrids. Fortunately, seed yields were generally high and adequate seed supplies are anticipated for 1994 planting.

DMD = DRY MATTER DIGESTABILITY (higher percentage means greater energy content)

FD = FIBER DIGESTABILITY (the measure of the degree of fermentation of fiber, high FD is desirable)

NDF = NEUTRAL DETERGENT FIBER (the measure of fiber content, higher levels mean lower energy)

CP = CRUDE PROTEIN (higher protein levels require less supplementation)

DMD = DRY MATTER DIGESTABILITY (higher percentage means greater energy content)

FD = FIBER DIGESTABILITY (the measure of the degree of fermentation of fiber, high FD is desirable)

NDF = NEUTRAL DETERGENT FIBER (the measure of fiber content, higher levels mean lower energy)

CP = CRUDE PROTEIN (higher protein levels require less supplementation)

TABLE 24

Index for 297 hybrids from 38 seed companies entered in 1569 county tests in the 1993 Michigan Corn Performance Trials. Numbers within parentheses refer to table numbers in which the hybrid appears. Company names used in association with hybrid numbers refer to the brand and the numbers are the variety (hybrid) designation.

Mycogen Plant Sciences

AgriGene AG 3965 (5,6,7,8,9,10,11,12)
AgriGene AG 4250 (9,10,11,12)

Amcorn Hybrids, Inc.

Amcorn PSX 0020 (1,2,3,4,17,18,19,20)
Amcorn PSX 1185 (13,14,15,16)
Amcorn PSX 3333 (9,10,11,12,13,14,15,16,17,18,19,20)
Amcorn PSX 4747 (1,2,3,4,5,6,7,8,9,10,11,12)
Amcorn PSX 5555 (5,6,7,8,9,10,11,12)

The Andersons

Andersons PSX 345 (5,6,7,8)
Andersons PSX 370 (1,2,3,4)
Andersons PSX 405 (1,2,3,4)

Asgrow Seed Co.

Asgrow RX 433 (9,10,11,12)
Asgrow RX 497 (5,6,7,8,9,10,11,12)
Asgrow RX 510 (5,6,7,8)

Beck's Superior Hybrids

Beck's 48 (1,2,3,4)
Beck's 54XA (1,2,3,4)
Beck's 57 (1,2,3,4)

Blaney Seeds

Blaney 405 (5,6,7,8,9,10,11,12)
Blaney 2070 (5,6,7,8,9,10,11,12)

Callahan Enterprises, Inc.

Callahan C725 (9,10,11,12)
Callahan C729 (5,6,7,8,9,10,11,12)
Callahan C7245 (1,2,3,4,5,6,7,8,9,10,11,12,17,18,19,20)
Callahan C7249 (1,2,3,4,5,6,7,8)
Callahan C7252 (1,2,3,4,5,6,7,8,17,18,19,20)
Callahan C7258 (17,18,19,20)
Callahan C7259 (17,18,19,20)
Callahan C7337 (1,2,3,4,5,6,7,8,9,10,11,12)

Cargill Hybrid Seeds

Cargill SX269 (1,2,3,4,5,6,7,8)
Cargill 809 (21,22,23)
Cargill 2037 (13,14,15,16)
Cargill X2497 (13,14,15,16)
Cargill 2927 (9,10,11,12,13,14,15,16,21,22,23)
Cargill 3427 (5,6,7,8,9,10,11,12,13,14,15,16)
Cargill 3777 (5,6,7,8,9,10,11,12)
Cargill 4277 (1,2,3,4,5,6,7,8,9,10,11,12)

Ciba Seeds

Ciba 4024 (13,14,15,16)
Ciba 4070 (9,10,11,12)
Ciba 4120 (9,10,11,12,13,14,15,16)
Ciba 4172 (9,10,11,12)
Ciba 4273 (5,6,7,8,9,10,11,12)

AgriGene AG 5660 (1,2,3,4)

Amcorn PSX 5757 (1,2,3,4,5,6,7,8,9,10,11,12,17,18,19,20)
Amcorn PSX 9009 (1,2,3,4,5,6,7,8,9,10,11,12)
Amcorn PSX 9292 (1,2,3,4,5,6,7,8,17,18,19,20)

Andersons HSX 2241 (9,10,11,12)
Andersons HSX 44011 (9,10,11,12)

Asgrow RX 623 (1,2,3,4,5,6,7,8,9,10,11,12)
Asgrow RX 707 (1,2,3,4)
Asgrow RX 745 (1,2,3,4)

Beck's 60MVP (1,2,3,4)
Beck's 63MVP (1,2,3,4)
Beck's 6111 (1,2,3,4)

Blaney 2100 (5,6,7,8,9,10,11,12)

Callahan C7339 (1,2,3,4,5,6,7,8,9,10,11,12)
Callahan C7348 (1,2,3,4,5,6,7,8)
Callahan C7353 (17,18,19,20)
Callahan C7425X (5,6,7,8,9,10,11,12)
Callahan C7434X (1,2,3,4,5,6,7,8,9,10,11,12)
Callahan C7435X (1,2,3,4,5,6,7,8,9,10,11,12)
Callahan C7446X (1,2,3,4,5,6,7,8,9,10,11,12)
Callahan C7452ITX (1,2,3,4)

Cargill 4327 (1,2,3,4,5,6,7,8,9,10,11,12)
Cargill X5307 (1,2,3,4,5,6,7,8)
Cargill 5327 (1,2,3,4,5,6,7,8,9,10,11,12,17,18,19,20)
Cargill X6208 (17,18,19,20)
Cargill 6227 (1,2,3,4,5,6,7,8,17,18,19)
Cargill 6677 (1,2,3,4,5,6,7,8)
Cargill 7877 (1,2,3,4)
Cargill 7897 (1,2,3,4)
Cargill 119564 (21,22,23)

Ciba 4282 (5,6,7,8)
Ciba 4372 (1,2,3,4,5,6,7,8,17,18,19,20)
Ciba 4394 (1,2,3,4,5,6,7,8,17,18,19,20)
Ciba 4494 (1,2,3,4)

Crow's Hybrid Corn Company

Crow's 210 (5,6,7,8,9,10,11,12,17,18,19,20)
Crow's 370 (1,2,3,4,5,6,7,8,9,10,11,12)
Crow's 375 (1,2,3,4,5,6,7,8,9,10,11,12,17,18,19,20)

Dairyland Seed Company, Inc.

Dairyland DX-1100 (9,10,11,12)
Dairyland DX-1110 (1,2,3,4,5,6,7,8,17,18,19,20)
Dairyland Stealth-1108 (1,2,3,4,5,6,7,8,9,10,11,12)
Dairyland Stealth-1114 (1,2,3,4)
Dairyland Stealth-1115 (1,2,3,4)
Dairyland Stealth-1175 (13,14,15,16)
Dairyland Stealth-1180 (13,14,15,16,21,22,23)
Dairyland Stealth-1185 (13,14,15,16,21,22,23)
Dairyland Stealth-1187 (13,14,15,16)

Dekalb Plant Genetics

Dekalb DK306 (13,14,15,16)
Dekalb DK352 (13,14,15,16)
Dekalb DK381 (9,10,11,12,13,14,15,16)
Dekalb DK401 (9,10,11,12,13,14,15,16)
Dekalb DK471 (5,6,7,8,9,10,11,12)
Dekalb DK485 (5,6,7,8,9,10,11,12,17,18,19,20)

UAP Seed Company

Dyna-Gro 5313 I PRO (5,6,7,8)

Gen-Tech Farm Seeds, Inc.

Gen-Tech 1073 (1,2,3,4)

Sommers Bros. Seed Company

Golden Harvest H-2331 (1,2,3,4,5,6,7,8,9,10,11,12)
Golden Harvest H-2349 (1,2,3,4,5,6,7,8,9,10,11,12)

Great Lakes Hybrids, Inc.

Great Lakes GL450 (5,6,7,8,9,10,11,12,17,18,19,20)
Great Lakes GL471 (5,6,7,8,9,10,11,12,17,18,19,20)
Great Lakes GL496 (5,6,7,8,9,10,11,12,17,18,19,20)
Great Lakes GL515 (5,6,7,8,9,10,11,12)

Gries Seed Farms, Inc.

Gries GSF 2393 (5,6,7,8,9,10,11,12)
Gries GSF 4100 (5,6,7,8,9,10,11,12)

Fred Gutwein & Sons, Inc.

Gutwein 2120 (5,6,7,8,9,10,11,12)
Gutwein 2434 (1,2,3,4)

HyPerformer Seed Company

HyPerformer HS 9330 (5,6,7,8)
HyPerformer HY 9334 (5,6,7,8,17,18,19,20)
HyPerformer HY 9339 (5,6,7,8)
HyPerformer HY 9385 (1,2,3,4,5,6,7,8)
HyPerformer HS 9388 (1,2,3,4)
HyPerformer HS 9408 (1,2,3,4)

Crow's 401 (1,2,3,4,5,6,7,8,9,10,11,12,17,18,19,20)

MICHIGAN STATE UNIVERSITY EXTENSION

MSU is an Affirmative-Action Equal Opportunity Institution. Cooperative Extension Service programs and materials are open to all without regard to race, color, national origin, sex, handicap, age or religion. ■ Issued in furtherance of Cooperative Extension work in agriculture and home economics, acts of May 8, and June 30, 1914, in cooperation with the U.S. Department of Agriculture. Gail L. Imig, director, Cooperative Extension Service, Michigan State University, East Lansing, MI 48824. ■ This information is for educational purposes only. Reference to commercial products or trade names does not imply endorsement by the Cooperative Extension Service or bias against those not mentioned. This bulletin becomes public property upon publication and may be reprinted verbatim as a separate or within another publication with credit to MSU. Reprinting cannot be used to endorse or advertise a commercial product or company.
