# Tee Shots

The additional nine holes at Burnham and Berrow have so delighted the Club that there is now talk of extending these holes to 18. Work started on nine holes in April and the greens, tees, and fairways have now been sown. The holes, like their ancestors just alongside, have been built out of the sand dunes, in amongst buckthorn and reeds. Huge quantities of clay soil and peat have had to be incorporated with the sand to form a moisture-retaining soil.

It is customary nowadays to get through the construction work on new golf courses in one season, starting in April and sowing in September. The programme frequently becomes rushed and is all too dependent on those dreams of long hot summer days. The lessons of starting early are clear from some of the courses which are nearing completion this Autumn.

The new course at Minchinhampton looks very well after a September sowing. Work started last December. The site was very stony and the contractors employed a magnificent Dutch weapon.

The machine rotavates the soil which is pushed against a screen, allowing the stones to drop below the loose earth. This machine also fertilises and sows in a single operation.

The two new championship courses at Fox Hills, Chertsey, are now in progress. Work on the East Course did not start until June and the contractors are having a hard job to get sown this Autumn. The greens and tees have nevertheless been sown, bright green islands set in the brown cultivated land and the autumn trees. The West Course is planned entirely in woodland and plantations. Work has already started on tree clearance and it is hoped to continue construction over the winter months, ready for a spring sow. The two courses should both be ready for play in July 1975.

Next month we print the first of a series of talks which were delivered at the First British Turfgrass Symposium last October. In time we hope to produce the whole of the Symposium Proceedings in a single volume.

# The Use of the Mazide Range of Regulators in Golf Course Management

by D. H. Gooding Technical Director Synchemicals

For many years Synchemicals have marketed a range of products based on Maleic Hydrazide, a compound possessing certain growth inhibitory as well as herbicidal properties and widely used in Amenity Horticulture as a labour saving alternative to many routine maintenance operations.

These materials have many applications in modern golf course management, their main uses being as follows.

(a) To inhibit the growth of grass and thus reduce the frequency of cutting grassland areas where normal mowing is either impractical or undesirable. Steep banks, areas planted up with young trees, verges and areas of rough are all costly in both man hours and expense, requiring to be cut either by hand or with the smaller type mowing machines.

(b) To retard the growth of certain hedge plants such as Privet, Quickthorn and Pyracantha and thereby reduce the amount of trimming normally required.

(c) To reduce the amount of sucker growth on established trees improving the appearance of specimen trees and at the same time avoiding a build-up of low-level vegetation.

(d) A new development whereby Maleic Hydrazide has been found effective in preventing the fruit set on certain ornamental trees. Trials and

commercial sprayings during this last season have shown that Horse Chestnuts, Gingko, Catalpa and Ash when sprayed during the flowering season have been successfully defruited. This has resulted especially with horse chestnuts in a great reduction in damage, no conkers being present in the Autumn.

Modern formulations of these growth regulators especially the introduction of weather-proofed or rainfast preparations have made treatments using Maleic Hydrazide far more reliable but it is important that the recommendations for use are carefully followed if the best results are to be obtained.

## (1) As a Grass Growth Regulator

Spring treatment will inhibit the growth of grasses for up to 12 weeks and often longer after application whilst Autumn treatment will delay the start of growth for up to half this time at the beginning of the following season. Grass at the time of spraying should be up to 4-6 inches high and in an active state of growth, maleic hydrazide takes some 10 days to become fully effective and some further growth after spraying will occur. If treatment has been delayed the grass can be cut first and spraying carried out when the grass has recommenced growth.

High volume is recommended using a minimum of 40/50 gallons of water per acre, spraying carried out using cone type nozzles with the spray boom at a height of 15/18in. above the foliage.

In practice best results are obtained from the spring application (mid March/May) shortly after the grass has commenced to grow, and for areas where two applications per year are recommended a second spray 8/10 weeks later will then keep the grass retarded for the rest of the season.

Maleic Hydrazide although retarding some broad-leaved weed species, e.g. Cow Parsley and Hogweed, has little effect upon most broad-leaved weeds and for their effective control the addition of a selective weedkiller is necessary.

Application should always be made when the grass is in an active state of growth and spraying avoided during periods of drought. Rainfall within 24 hours of spraying will reduce the efficiency of treatment although the

Prepared spray although normally applied by tractor-mounted equipment can be applied using a Knapsack Sprayer to treat small areas or plots where tractor access is not possible. Coarse jets should be used and equipment calibrated to spray a minimum of 1 gallon of prepared spray per 100 sq. yds.

When preparing the concentrate for spraying the spray tank should be first half filled with water to which should be added the required amount of concentrate. This should be well mixed and if a selective weedkiller is also being used, this added in the same way. The concentrates added the spray tank should then be filled to the final required level and agitated or stirred thoroughly before spraying is commenced.

#### RATES OF APPLICATION PER ACRE

Size	Time of Application	Mazide	Mazide 36 or Mazide 3600	Mazide Selective
Areas of rough single application per annum, normally with selective weed killer	Mid March/ May	2 galls. Mazide plus, if required, 5 pts. Syford or 4 pts. Forester	1½ galls. Mazide 36 if required 5 pts. Syford or 4 pts. Forester	2½ galls. Mazide Selective
Tree plantings* Grass verges, bankings, etc. First spray normally with selective weed killer combined	Mid March/ May	10 pts. Mazide plus is required 5 pts. Syford or 4 pts. Forester	1 gall. Mazide 36 plus if required 5 pts. Syford or 4 pts. Forester	2 galls. Mazide Selective
Second spray: Grass regulator only	8/10 weeks after first treatment	10 pts. Mazide	1 gall. Mazide 36	1 gall. Mazide 36 or 8/10 pts. Mazide

\* Areas planted with young trees, care should be taken if a selective weedkiller is to be added to the maleic hydrazide.

use of Mazide 3600 to which a special sticker has been added will greatly reduce the effects of adverse weather conditions. Ideally spraying should be carried out when the grass foliage is dry and the applied chemical able to dry before rain is expected.

The recommended dosage rates listed above are per acre but can be scaled down for smaller areas using the fact that 2 gallons (16 pints) concentrate per acre is equivalent to 1 pint to treat 300 sq. yds.

# **BOMFORD BANDIT FLAIL MOWER**

Unchallenged on golf courses, parks and sports ground outfields. The Bomford Bandit mows and mulches in one pass, cutting a broad swath 67 inches wide and covering 2/3 acres per hour under normal conditions. Fits any tractor over 30 b.h.p.

**Flail Knife cutters** – are robust and do not require sharpening. Mulching action swiftly rots material – avoiding after collection problems and grass lumps affecting ball play.

**BANDIT 2500** model available with a big 8' 3" cutting width.

Tel: Bidford-on-Avon (078-988) 3383 Telex 311081.

### (2) Application to Retard Hedge Growth

The dilute spray is prepared using 8 pints Mazide or 6 pints Mazide 36 in 50 gallons of water to treat 1 acre of hedge (calculated as the area of 2 sides and a top hence a hedge 6 ft. high and 3 ft. wide would have an area of 5 sq. yards per yard run). Smaller areas again can be treated using a knapsack sprayer with coarse nozzles using 3 fl. oz. Mazide or 2½ fl. oz. Mazide 36 in 1 gallon of water to treat 100 sq. yds. of hedge. All foliage should be sprayed to the point of run-off. Treatment is best carried out late April/May and treated hedges may be trimmed 10/14 days after spraying if required.

### (3) Application to Prevent Sucker Growth

Existing sucker growth should be removed and the prepared spray either brushed on or applied as a coarse spray. All the bark should be thoroughly wetted to the point of

run-off. Treatment is best carried out from March to May and because of the slow absorption of Maleic Hydrazide the use of Mazide 3600 is recommended. The dilute spray is prepared at the rate of 1½ pints Mazide 3600 to 1 gallon of water, a gallon of the prepared spray being sufficient to treat 80 sq. yds. of bark surface.

### (4) Application to Prevent Fruit Set on Ornamental Trees

Here tentative recommendations used successfully during this season involved the use of 4 pts. Mazide or 3 pts. Mazide in 20 gallons of water, the prepared spray being applied as an overall mist spray during the flowering period.

The value of growth regulators in Amenity Horticulture is now generally accepted but as with all chemicals their value in practice depends on them being properly applied at the correct rate, and at the correct time of the year and when the weather conditions are suitable.

## Dear 'Besieged' of Tunbridge Wells...

If it's any consolation, you are not alone in your difficulties.

Every week, groundsmen and greenkeepers write to me from all over the country, worried about the state of their turf; and the effect it's having on their players.

I tell them that what they really need is a proper turf service. The best one I know of is operated by Fisons of Cambridge.

Not only do they offer an unusually fine range of products, but something that is invaluable in this day and age—a sympathetic ear.

They'll send a man round to see you, free. You can talk things out and sort things out. (All their people are thoroughly trained in all aspects of turf culture.)

Then he'll recommend the best course of action in your particular case; although, of course, you'll be under no obligation.

Anyway, why don't you get in touch with them yourself? The address to write to is: Fisons Ltd., Recreational and Industrial Dept., Harston, Cambridge, CB2 5HU. Or you may call them at 0223 870312.

Meanwhile, may I suggest a stout padlock?

**The complete fine turf service.**
