PRESIDENT'S MESSAGE

Our July meeting at Bonnie Dundee G. C. proved to be very successful. It was our largest gathering of Superintendents this year. The golf course was in its usually fine condition and Al Rauch, the Superintendent, is to be congratulated for having the course in such a condition for the middle of July. Miss Harms, the owner, showed us that she is still a good friend of our Association by serving such a delicious meal. All in all the day was a high success.

Next month our meeting will be at Chapel Hill Country Club near Mc Henry. This will be a long trip for many of us, so plan on leaving a little earlier than usual. Don Gricus will be our host. Don has recently applied for membership in our Association as a B member. He has trained himself for a position as a Pro-Superintendent on a nine hole golf course. His training as a Pro was under Tony Holguin at Midlothian Country Club and his training as a Superintendent was under Bob Williams for one season. Don promises us that we will have a good time.

John Ebel, chairman of the Educational Committee has arranged through Dudley Smith, a member of his committee, to have Dr. Joseph M. Duich, Assistant Professor of Agronomy, Penn State University, speak to us on what it takes to go to their Winter School at Penn State. If any of you have men working for you that might be interested in attending a turf school, bring them along. You will be helping the profession. Every Superintendent should be training at least one man to become a Superintendent. If this man is capable of going to school you should be prompting him to do so.

See you on August 7, 1961 at Chapel Hill Country Club.

Ted Woehrle, President

COMING EVENTS

Our September meeting will be held at the Skokie Country Club. This is our annual joint meeting with The Wisconsin Superintendents.

The October meeting will be held at Flossmoor Country Club. Our annual golf tournament will be held at this meeting.

FROM THE NATIONAL

James E. Thomas, Chairman of the Advisory Committee, requests that each Chapter Association appoint two delegates to the 1962 Advisory Committee meeting in Miami Beach.

The names of these delegates should be forwarded to

the Headquarters Office as soon as possible (final deadline October 1, 1961).

Each delegate should write a memorandum including ideas and suggestions on Association affairs as gathered from his chapter. These matters will be collected by Chairman Thomas and placed on the Agenda for the Annual Advisory Committee meeting in Miami Beach. We should all be thinking about ideas that we would like to see come about, so when we select two members to represent us on this committee they will be able to voice an opinion of the Midwest Chapter.

GCSAA tradition has established the Advisory Committee as the nerve center for new ideas and functions. It is the responsibility of this committee to consider, develop, review and screen any and all matters pertaining to the GCSAA. Items generally considered include membership services, by-laws, general operations, educational services, and new projects. However, no limitations are placed on the subject matter.

In selecting delegates for the Advisory Committee, we should select men who can think wisely and objectively, and who can express their ideas. Delegates should have good knowledge of Chapter affairs and GCSAA activities and history. Of course, these delegates must be GCSAA members.

ANNUAL GCSAA GOLF TOURNEY—MIAMI BEACH CONFERENCE

We have been asked by George L. Lamphear, Chairman of the Golf Tournament at Miami Beach to select our four best golfers between now and next winter to represent our local association as a team in this tournament. Maybe as an incentive we could offer to pay their entrance fee in the tournament.

POEM

The green keeper stood at the golden gate
His head was bent and low.
He merely asked the man of fate
Which way he ought to go.
What have you done, St. Peter said
To seek admittance here.
I ran a country club on earth
For many and many a year.
St. Peter opened wide the gate
And gently pressed the bell.
Come in, he said, and choose your harp
You've had your share of hell.

— Anonymous

JOB ANALYSIS CAN CUT WASTE OUT OF MAINTENANCE

By Robert M. Williams

Supt., Bob O'Link GC, Highland Park, Ill.

This article is condensed from a speech made by Williams at the annual USGA Green Section meeting.

What does it cost the club members for the annual operation of their private clubs? The round figure of \$500,000 for a 300 member club is fairly realistic, possibly somewhat conservative. As we get closer to our subject, we find that the course maintenance costs lie in the range of \$40,000 to \$80,000. So taking the average figure of \$60,000, we can conclude that the cost of operating the course proper is about 12 per cent of the member's expense dollar. As we get closer to the more detailed consideration of the grounds labor, we are speaking of a \$25,000 to \$50,000 expense which, in turn, represents 5 to 10 per cent of the member's expense dollar.

These figures should place course maintenance costs and labor costs in a better light for further study. When we get around to thinking in terms of economics, savings and budget cuts at our clubs, the grounds department doesn't lend itself to being a major area for consideration. May I add that efficiency doesn't necessarily indicate a reduction of cost or expense but more appropriately the process of reducing waste to a minimum and getting the most out of the money expended.

Profession Has Advanced Rapidly

The supt. is the primary figure concerned with effecting job analysis studies and planning. So it is contingent upon this man in management as to the type of studies and records that he will engage in and as to how effectively they can be put to use. A brief evaluation of the supt. of today reveals generally a highly dedicated individual whose profession has progressed rapidly over the past 30 years and especially so in the post war years. While we are still a predominantly practical group, we are gradually changing to the more scientific, more educated and more executive type of individual.

Our profession has advanced rapidly over the past 30 years.

Golf has advanced so rapidly that we have not kept pace by training new supts. The clubs must share part of the responsibility by not acknowledging the supt's comparative value to the club and establishing income standards that create a more inviting and attractive environment of employment for men better qualified to fulfill the club's needs. In our international assn. we have about 1000 men from a potential of 6000 clubs who are progressive enough to become members of their professional trade group. This tells me that about five of six clubs possibly are getting by on substandard grounds management. Fortunately for golf, there are supts. who have continued to educate themselves, and clubs that have wanted increasingly better playing conditions. Therefore progress continues and at the same time the gap between supts. widens.

Maintenance Objectives

Efficiency implies the accomplishment of an objective with minimum waste. Practically every club has a different objective when it comes to a standard of course maintenance. So we have many variations of standards. In illustration we can compare a well groomed private club and an austerity minded municipal course as two extremes. Most of the refined operations of trimming and grooming at the private club are desired and necessary. But most of these same practices would be totally extravagant if applied to the public course. It doesn't need bentgrass tees and fairways. It doesn't need collars around the greens, edged traps, fresh sand annually and so forth. The time required for mowing a green at a club desiring top putting surfaces is bound to be greater than the time allowed for the same operation at a profit minded public course where standards are relatively low. In most mowing operations speed reduces quality, as we all know.

Fortunately, in large metropolitan areas, we usually find a few clubs desiring similar standards of maintenance. They provide a opportunity for discussion of many common factors, yet they cover quite a spread of overall aims with variable pocketbooks to pay the bills. So in discussion of efficiency of maintenance we have to adjust the shoe to fit the foot.

Informal Type Studies

Time and motion studies on golf courses must of a necessity be pretty much informal. These have to be

made by observations by the supt., keeping of minimum records and by making pilot studies from time to time by both supt. and perhaps the various golf assns. Course time and motion studies can't be compared to those of factories.

"Job Analysis" is more appropriate than "Time and Motion Study." On golf courses we must correlate efficiency with money available, the supt., amount of play, club objectives, the grounds staff, weather, unusual conditions of soil, drainage and possibly a few other factors.

The supt. should be aware of these factors and direct his attentions to continued observation. I have tried to develop an approach so that whenever I observe our men working, I ask myself this question, "Is there a better way to do this job without sacrificing quality?" A supt. must look at all the details and movements of his men fertilizing a green, for instance, and then try to eliminate wasteful effort. This is just another reason why we tell supts. to get out of their overalls and become worthy of the title as well as the salaries they aspire to.

Interference in Maintenance

Efficiency in maintenance involves the factor of player interference to the workmen as well as workmen interference to the players. Neither one is desirable. The subject covers a wide range of discussion. Interference with the workmen has become a nightmare to most supts. Considering daylong play, how long can we allow for the overall cutting of the greens? How early can we and should we start the crew? How much equipment do we need? We can only answer these questions by being on the job, alert to the situation, and making a practical analysis.

If mowing greens ahead of players (and they have to be mowed at least six times a week) was our only worry, we'd hire 18 men, give them each a mower and be through with the job in 45 minutes. Then we would face the problem of keeping these men productively occupied for the rest of the day without interfering with the players. This gets us around to the realistic point of how many men we require and the timing and assignment of their duties. For a better insight into the problem, let me tell you what our basic work unit of men is at Bob O'Link. We strive for top quality turf, we have no women to contend with and we have adequate equipment. Most of our play is in the afternoon. In our normal daily operation four men mow greens in the morning. These same men often rake traps in the afternoon. One man continuously mows rough. One man mows tees, one changes cups, tee towels and markers, one man mows green banks and tee banks,

"PMAS" - Crabgrass & Disease Control
 "CADDY" - Economical Liquid Cadmium Fungicide
 "SPOTRETE" - 75% Thiuram Fungicide
 "C-531" - The old reliable Cadmium, Zinc, Calcium Fungicide
 "PM2,4-D" - The all around weed Killer including Silvercrabgrass control.
 "ALL-WET" - Added to water it allows quicker and deeper penetration... enables soil to retain needed moisture.

"THIMER" — A broad-spectrum wettable powder fungicide and crabgrass killer containing phenyl mercury and thiram.
 "CAD-TRETE" a broad-spectrum wettable powder fungicide containing cadmium and thiram.
 "SUPER METHAR" — the new "AMA" liquid crabgrass killer.

two men mow fairways or repair equipment or spray chemicals, and one or two men work nights on irrigation. About 6 of 12 men are engaged all day in basic work and the remainder are available for half the day for the other 1001 jobs needing attention. When we analyze the situation we have about a dozen men caring for 160 acres of fine turf, or an equivalent of about 13 acres apiece. If we didn't use work analysis studies I don't know how we would get along as well as we do.

Routing and Assignment

Job assignment is part of the answer to efficiency, but a point not to be overlooked is the routing of the men and equipment. Here again there are about as many variations as there are golf courses. My experience has covered 18, 36, and 54 hole operations of square, rectangular and random property outlines. All this enters into the picture of the studying and analyzing of operations. Sometimes the centralized system of having one centrally located service building is the answer to greater efficiency. At other times the decentralized system with several outlying tool sheds may help to reduce excessive unproductive travel time to and from assignment areas.

Equipment Studies

We have thus far concerned ourselves mainly with the use of men. What about some of the major equipment items? Do they also need to be studied for efficiency? Yes, perhaps more than they have been. A few years ago at the Beverly in Chicago, I realized that I was fighting a losing battle in the maintenance of close cut bent and poa annua fairways.

The irrigation system had a capacity of 450 gpm, meaning we could probably water fairways about once every three nights. I often saw short-rooted poa annua grass wilting before my eyes for the lack of moisture. Still I knew it would be at least another 24 hour before we could give relief with another watering. I felt that we had only one alternative to improve the situation — by changing our irrigation system so that we could water all tees, greens and fairways in one night. Investigation revealed that by installing a second pumping station, we could accomplish this. Upon presentation of our findings to the committee and board, the wisdom of the study was understood and accepted. There has been a considerable improvement in the fairways with a minimum loss of poa annua from lack of water.

Study Mowing Operation

Mowing of the various areas of the course is another item of equipment usage that should be constantly noted with an eye towards eliminating waste of time and effort. A simple example might be taken from the mowing of the collar adjacent to the putting surface. I noted that my men were making as many as four complete circles around the greens to mow variable width collars. It appeared that by reducing collars to a uniform width we could cut the mowing in half with only two mower widths for the collar. It worked and we have made this standard procedure ever since. Another thought on equipment is the use of multiple units. I find, for instance, that by using two 7-gang fairway mower units, we reduce an over-all job from about 8 hours to a 3½ hours.

Fairway Fertilization

Fairway fertilization is another operation that has always taken its toll of hours. It required about three days with an old conventional 6- or 8-ft. spreader to

fertilize our 18 fairways. Weather changes, play, and other factors sometimes entered into the picture, too, and we found it was taking a week or more to get the job done. We needed a more efficient method of fertilizer distribution. We came up with an improved technique of using a cyclone type spreader covering approximately 40 to 50 ft. to a swath and a three-day job was reduced to no more than six hours or less. We also worked out a plan for using the same machine on our tees and now all 18 are handled in about 50 minutes by one man instead of two working all day.

REVIEWING THE "HEIGHT OF CUT" WITH *CHANGING TIMES*, THE KIPLINGER MAGAZINE

Mowing the lawn takes brains. If that sounds like a joke, okay. But don't joke about it with anyone who is a professional grass cutter. People like superintendents of golf courses take their mowing mighty seriously. They will tell you that by using your head as well as the mower you can thicken the turf, outwit weeds and cause crab grass to commit suicide - maybe.

To get their reasoning, look at it for a moment from the grass's point of view. The grass leaves take the raw nutrients furnished by the roots and convert them into food. Sunlight is necessary for this process, known as photosynthesis, so the upper parts of the leaves do most of the work. During good weather the leaves produce food faster than necessary and store up the surplus. Some is stored in the leaves, and some in the stolons and crown.

Now, you can see what happens when you lop off a big part of the leaves. You slow down the food-manufacturing process and also destroy some of the stored-up food. It is a real shock to the grass's system. The way to lessen the shock is to take off only a little bit of the leaves each time, and that, of course, means mowing frequently.

How often you should mow is an arithmetical function of the height of cut. Here is how the Green section of the U.S. Golf Association has worked the problem out. To give the grass a chance to recover from each mowing, no more than a third of the leaf surface should be clipped off at a time. That means that if you have the kind of grass that thrives when cut at one inch, you should mow it as soon as it has grown to a total height of an inch and a half. But if you have grass that does better at two inches, you can wait until it has grown to a total height of three inches. Since it takes half as long for grass to grow half an inch as it does for it to grow a full inch, one-inch grass should be mowed twice as often as two-inch grass. In other words, the shorter the height, the more frequent the cut.

The chief grasses that will thrive at a height of two inches are the bluegrasses and the fescues. They produce only a limited number of leaves, and these leaves tend to grow upright. Close cutting is bad for two reasons. First, it removes almost all the food-manufacturing capacity and much of the stored food. Second, it drives such diseases as leaf spot from the leaves down into the crown. So bluegrass and fescue should not be cut to less than an inch and a quarter, and most experts recommend an inch and a half to two inches. The two-inch cut, as shown above, requires the least mowing.
