

## Director's Column

### ASSOCIATION INVOLVEMENT

By Bruce R. Williams, CGCS

The Midwest Association of Golf Course Superintendents has a membership of close to 500 members. Our month-to-month operations and long-range planning are carried out by your Board of Directors, which is comprised of 10 members of the Association. While the Board is only made up of 2% of the entire membership, it makes the decisions for the whole Association. Our Board gives freely of its time to serve the Association to the best of its abilities.

Each year it becomes increasingly difficult to select individuals for nomination to our Board of Directors. One of the reasons for this is the lack of participation by our members on the various committees of the MAGCS. Many of our committees could use a helping hand from our members-at-large. Getting involved on the committee level will serve several purposes. We need the input of a broader base of individuals to provide the program that our members want. Committee involvement will also give individuals insight into the operation of the MAGCS and give our Association a larger number of individuals prepared to seek nomination to the MAGCS Board. Please give this some consideration as new committees are formed after the elections in November.

Improvement of programs is the goal of any association. This can be accomplished with some constructive criticism through the proper channels. Our Board is certainly open to any comments and suggestions from our members. Do you have an idea for a speaker or topic? Would you like to host a meeting in 1989? Is there a specific golf event that you would recommend for one of our meetings? If so, then let us know. Complaining about the Association, over cocktails, doesn't do any good. Address the appropriate committee chairman or the Board of Directors, preferably in writing, with your views. We definitely value your input.

### Have You Heard?

A normal blood pressure reading is 120/80. If the top number (systolic) consistently exceeds 140, or if the bottom number (diastolic) consistently exceeds 90, you should be working with a physician to get your blood pressure back to normal.

## "A Belated Update on the Tool From Down Under"

by Fred Opperman, CGCS

Back in June I wrote about a roller that I had received from Australia that was built to roll golf greens. At that time I had promised to write a follow up article since I didn't have much time to use the machine and get any data on it before the June issue went to press.

Well, since then I have been able to get some data when I used it to roll the greens at Glen Oak C.C. during the summer. I need to recap, I feel, somewhat on the description of this roller to refresh some people of what it is and what it can do.

The roller was designed first in Australia to roll bowling greens and it was built for that purpose. It was originally 5' long and about 18'' wide, with 2 rollers. But the roller built for rolling golf greens is only 3' long and 2' wide with 3, 4½'' rollers. Weight is about 600 pounds with machine and operator (more depending on weight of the operator of course).

*Dr. Bill Daniel trying his skills at rolling a green at Glen Oak C.C.*

The machine rolls sideways to roll a green. You sit on it facing the length of the machine and it rolls left or right, depending which foot pedal you depress. It has a handle bar and two foot pedals and a throttle. That's all for controls. It is simple to operate, once one gets the hang of moving sideways. It is also surprising on how fast it travels across a green — 4 to 5 miles per hour I would think.

My thought of getting this machine was to roll the greens occasionally instead of cutting them down next to nothing and putting a great deal of stress on the plants. I found that after rolling a green I could increase the speed plus or minus about 24 inches on most readings. I was also concerned about compaction of the greens, so I borrowed a penetrometer from Jim Latham of the USGA Green Section.

The use of this instrument is all relative. One has to get the feel of it and take many readings over a period of time to see if there is a difference. I found that it increased the compaction by about two numbers after rolling. For example, if the reading was a 7 before rolling, after rolling it showed a 9 or a 10. The next day the reading on the penetrometer was a number or two lower. Also, the stimpmeter reading had fallen off from the high of the day before, but it was still 10 to 12 inches faster than a green that had not been rolled. By the third day after rolling, the speed of the rolled greens were the same as the other greens which had not been rolled. (continued on page 4)

## Executive Blend BLUEGRASS SOD

**THE BLEND**—Combination of 5 disease resistant cultivars chosen on the basis of adaptability to a variety of growing conditions.

**SOIL TYPE**—820 irrigated acres of sandy loam mineral soil.

**ROOTING**—Rapid establishment in any soil type with less water.

**SERVICE**—On-Time—Radio Dispatched—Forklift Delivery.

**PENNCROSS CREEPING BENT SOD** | 75% Sand Base

Quality Supplier of  
Seed, Fertilizer,  
Chemicals, and  
Equipment.

**HUBER RANCH  
SOD NURSERY INC.**

Schneider, IN 219/552-0552

- IL 800-553-0554

The uses I foresee of this machine are not just for faster greens. It can also be used during construction of greens or tees. When it comes down to the final rolling, this roller could be used before seeding or sodding and then again after seeding or sodding to roll the seed or sod for better contact with the soil. In the Spring of the year most northern courses roll their greens before cutting to smooth them out. This roller would work fine, for it is fast, doing a 5,000 square foot green in under 10 minutes. Another use would be rolling the greens after core cultivation. This rolling would help smooth the surface of the greens and return some of the speed that was lost due to core cultivation. The roller would work well on tennis courts or croquet courts just as well as it does on a golf or bowling green.

I look at this machine as just another toll in our inventory needed to keep pace with the demands of our jobs. Just as we have coring machines, turf groomers, and top dressers, a roller is another tool to be used to do a critical, required task.

## We dug into the tall fescue control problem. So now you don't have to.

Introducing LESCO TFC™ Herbicide. The new, easy way to remove unwanted clumps of tall fescue without digging or spot-treating with a non-selective herbicide.

LESCO TFC is the first product to provide selective spot control of tall fescue in Kentucky bluegrass, bentgrass, fine fescue, bahia-grass and bermudagrass, while allowing desirable grass to fill in. This water dispersible granule offers convenience and accuracy. Order today!

Nationwide • (800) 321-5325  
In Ohio • (800) 686-7413

Always read and follow label instructions before using any chemical product.

If you would like more information on this machine, give me a call at (312) 858-0601 or call a Chicago Turf & Irrigation (312) 773-5555 salesperson for they are showing the machine around various courses.

## The Fall Turf Clinic/or Back to the Basics

The Superintendent has been His Own Flag Bearer! Others have elaborated on the Superintendent's basic awareness of His problems, that He brought to light Himself. Most will agree, the Superintendent has been instrumental in eliminating the problem, or controlling it. It was a pleasure to see and hear the Superintendent's conduct Their Own Turf Clinic once again. (To me, that's where it all started). While We are grateful for contributions from concerned avenues of mutual collaboration. It is a Blessing to feel the Comradeship of Superintendent's revealing Their findings, thoughts and solutions, in the realm of intimate revelation.
