

Using Prairie Plants in Golf Course Planting Beds

by Tom Voigt

Department of Horticulture, Univ. of Illinois

At many Chicago-area golf courses, increasing emphasis is being placed on the aesthetics of course and clubhouse grounds. Many different ornamental plants, including trees, shrubs, and flowering herbaceous plants, are employed to dress-up the grounds. Superintendents have found flowering perennials to be especially useful because of their wide ranges of color, size, and shape, and also because they can be long-lived and tolerant of local conditions. A great many of the commonly used flowering perennials originate in other parts of the world, and while some of these introduced plants perform adequately, others require excessive management to maintain their health and appearance.

An alternative to the use of introduced perennials is to employ native prairie plants. This is not to recommend the recreation of a native prairie, but to encourage the use of prairie plants in traditional, horticultural island beds and borders. Native prairie plants are often overlooked and under-used, whether mixed with introduced types or used alone. Prairie natives come in a wide variety of shapes, sizes, flowering periods, and colors, and by selecting them appropriately, an interesting, attractive, and low-maintenance planting can be achieved.

Benefits of Using Prairie Plants

There are a number of obvious benefits that native plants can provide. For instance, native plants often have fewer insect or disease problems because the plants and pests have evolved together. This coevolution frequently provides plants with resistance or tolerance to attack. Another benefit is that most native plants easily tolerate the broad range of environments often seen in the Midwest. Introduced plants, unaccustomed to local weather vagaries, may not withstand the year in and year out broad temperature fluctuations that are often encountered. Also, Midwestern soils can range from heavy, fine-textured clays to coarse, well-drained sands. Regardless of the specific local environment, there are normally natives that are tolerant. Wildlife attraction is another benefit of these plants; many native plants encourage visits by songbirds and butterflies. Finally, using a combination of forbs (flowering, herbaceous, broad-leaved plants) and grasses can often provide both a unique aesthetic experience, as well as an opportunity to provide education about the botanical heritage of an area.

Getting Started-Become Familiar with the Plants

When planning any landscape area, proper plant selection is important to the success of the planting. Because they may be unfamiliar, the first step in planning a prairie border or island bed is to become familiar with a number of native plants. Begin by selecting plants that are easy to grow and tolerate horticultural settings. Avoid plants that only do well in native prairie situations; these plants may not tolerate being moved into a bed. Tables 1 and 2 list prairie plants that have worked well together and are not difficult to obtain or manage. Many natives are also useful, but it may be wise to begin with a limited palette of

par ex
The Ex Stands For Excellence

Why the EX STANDS FOR EXCELLENCE in professional turf care.

Par Ex is the only professional fertilizer line containing IBDU, undisputedly the finest slow release Nitrogen source in the world.

IBDU gives you the highest level of WIN, or Water Insoluble Nitrogen. IBDU delivers all of its Nitrogen in a single growing season.

The Nitrogen release rate of IBDU is generally affected by only two factors: soil moisture and granule size.

Slower release makes Par Ex products perfect for your Fall Fertilization program.

Fewer applications are required, labor costs are cut.

The salt index of IBDU is the lowest of all commonly used fertilizer materials.

IBDU fights nitrate pollution because very little Nitrogen is lost through leaching or volatilization.

Choose from over 60 different product formulations.

Table 1. Prairie Plants for Landscaping

Scientific Name	Common Name	Flower Color	Spacing	Competitive w/ Invasives	Habitat	Propagation	Comments
<i>Aster multiflorus</i>	Lead Plant	purple	2 to 3'	no	dry	cuttings	Nitrogen-fixing woody shrub. Slow growing. Shiny in flower. Gray, pubescent foliage.
<i>Andropogon gerardii</i>	Big Bluestem, Turkeyfoot	reddish	2 to 3'	yes	mesic-dry	seed, division	Forms soil. Attractive in autumn when in flower. Can be planted as temporary screen. Warm-season grass.
<i>Aster longifolius</i>	New England Aster	purple	1 to 2'	yes	wet-mesic	seed	Very showy. Many selections made of this species.
<i>Bouteloua curtipendula</i>	Side-oats grama	purplish	15 to 24"	moderately aggressive	dry-mesic	seed, division	Warm-season grass. Mass for best effect.
<i>Ceanothus americanus</i>	New Jersey Tea	white	2 to 3'	no	dry-mesic	seed	Nitrogen-fixing shrub. Handmade white flowers.
<i>Cirsium palustre</i>	Stiff Tickseed	yellow	18 to 20"	yes	mesic	seed, division	Self-seeder. Performs well on poor soils.
<i>Delaenanthus nuttallii</i>	Shooting Star	white to pale pink	10 to 15"	no	wet-dry	division, seed	May be damaged by spring fires. May perform best with some shade.
<i>Echinacea purpurea</i>	Purple Coneflower	purple	1 to 2'	yes	dry-mesic	seed	Can be aggressive.
<i>Oenanthe lachnoloba</i>	Prairie Smoke	pink-red	8 to 15"	no	dry-mesic	seed, division	Sensitive to spring fires and competition from grasses. Mass as a face plant. Can form dense mats.
<i>Helianthus scaberrimus</i>	False Sunflower, Ox-eye	yellow	1 to 2'	yes	mesic	seed, division	Can form colonies.
<i>Eriogonum fasciculatum</i>	Junegrass	silvery to golden	12 to 18"	no	dry	seed, division	Cool-season grass, not competitive.
<i>Liatris pycnostachya</i>	Prairie Blazing Star	purple	6 to 12"	no	wet-dry	seed	Very showy.
<i>Panicum polyanthemum</i>	Switchgrass, Prairiegrass	pale yellow	18 to 24"	yes	wet-dry	seed, division	Aggressive. Several attractive cultivars available.
<i>Phlox pilularis</i>	Prairie Phlox, Downy Phlox	purple-rose	8 to 12"	no	wet-dry	stem cuttings, seed	May self seed.
<i>Rudbeckia hirta</i>	Black-eyed Susan	yellow	1 to 2'	yes	wet-mesic	seed	Aggressive, needs competition. Tall and showy.
<i>Rhus aromatica</i>	Prairie Petunia, Wild Petunia	lavender to purple	1 to 2'	no	dry-mesic	seed	Low-growing face plant. Attractive pale summer flowers.
<i>Schizanthus luteus</i>	Little Bluestem	bluish-red	12 to 20"	no	dry-mesic	seed, division	Warm-season grass. Attractive fall through winter.
<i>Silphium laciniatum</i>	Prairie Dock	yellow	3 to 4'	no	dry-mesic	seed	Tall and coarse.
<i>Solidago rigida</i>	Stiff Goldenrod	yellow	2 to 3'	yes	dry-mesic	seed, division	Attractive. Can be aggressive and may require competition. Seeds heavily.
<i>Sorghastrum nutans</i>	Indiangrass	brown	2 to 3'	yes	mesic-dry	seed, division	Aggressive, needs competition.
<i>Sporobolus vaginatus</i>	Prairie Dropseed	pale pink	15 to 24"	no	dry-mesic	seed, division	Attractive and delicate. Fine-textured. Fragrant.

Table 2. Prairie Plant Flowering Period and Heights

Plant	April	May	June	July	Aug.	Sept.	Oct.	Height
Prairie Smoke	XXXX	XXXX						6 to 16"
Shooting Star	XXXX	XXXX	XXXX					1 to 2'
Prairie Phlox, Downy Phlox	XXXX	XXXX	XXXX	XXXX				1 to 2'
Junegrass			XXXX	XXXX				1 to 2'
Lead Plant		XXXX	XXXX	XXXX	XXXX			1 to 3'
New Jersey Tea			XXXX	XXXX				1 to 3'
Prairie Petunia			XXXX	XXXX	XXXX			1 to 2'
Stiff Tickseed			XXXX	XXXX	XXXX			1 to 3'
Purple Coneflower			XXXX	XXXX	XXXX	XXXX		2 to 4'
False Sunflower, Ox-eye			XXXX	XXXX	XXXX	XXXX		2 to 6'
Yellow Prairie Coneflower,				XXXX	XXXX			2 to 5'
Black-eyed Susan				XXXX	XXXX			1 to 3'
Prairie Blazing Star				XXXX	XXXX			2 to 4'
Side-oats grama				XXXX	XXXX	XXXX		1 to 3'
Switchgrass				XXXX	XXXX	XXXX		3 to 5'
Prairie Dock				XXXX	XXXX	XXXX		3 to 8'
Big Bluestem				XXXX	XXXX	XXXX		3 to 8'
Little Bluestem				XXXX	XXXX			1 to 3'
Indiangrass				XXXX	XXXX	XXXX		2 to 6'
Prairie Dropseed				XXXX	XXXX			1 to 3'
New England Aster				XXXX	XXXX	XXXX		1 to 6'
Stiff Goldenrod				XXXX	XXXX	XXXX		2 to 4'

plants. A bibliography at the conclusion of this article provides several plant references that can be both interesting and helpful.

When learning about these plants, it is important to consider flower color, flowering period, spacing, height, and aggressive tendencies. Refer to Tables 1 and 2 to obtain basic plant information. Consult more complete references for plant drawings, photographs, and other information.

Habitat preference is also important. Most prairie plants perform best in full sun. Soil moisture preference vary from hydric (wet) to xeric (dry). Mesic soils are intermediate and plants listed as preferring moderate moisture may work best in most normal planting beds.

Some prairie plants can be aggressive and may invade adjacent areas through seed spread or by rhizomes or stolons. Use these plants carefully, and maintain them to limit their invasive characteristics. Reduce aggressive tendencies by planting vegetative invaders in restricted areas or by dead-heading seed spreaders before seed dispersal.

Designing the Planting Bed

After selecting a palette of plants to work with, create a plan for their use. Decide if the bed is to be a free-standing island bed seen from all sides or a border that will only be seen from one side. Do not try to recreate native prairies in which grasses normally make up more than 70 or 80 percent of the total plants.

Make the majority of plants in the design forbs to provide color and general structure to the bed, and accent the planting with grasses for a unique appearance.

General design recommendations that apply to other plantings also apply to this type of installation. Consider where the plants should be located — in the front, center, or rear of the bed. Plan so there are plants in bloom throughout the growing season and color combinations are pleasing. Do not ignore the late-autumn, winter and early-spring periods; some plants, especially grasses such as little bluestem or Indiangrass, can provide much interest when forbs and other ornamentals are typically not showy. Provide adequate space for plants to fully develop so that less-vigorous individuals are not crowded out.

Planting the Bed

When planting a prairie garden, prepare soils as you would any annual or perennial bed. Incorporate organic matter to improve heavy-clay or light-sandy soils. Use prairie plants adapted to mesic areas in this type of planting bed.

It is recommended that the area be planted using nursery-produced container stock. Do not dig native plants for transplanting. Several local nurseries (see source list at end of this article) produce small, inexpensive plugs or potted plants that transplant well and often flower earlier than producing your own plants from seed. These plants can be installed from spring through early fall, provided water is available. Do not plant in late fall; ground movement due to freezing and thawing can heave small plants out of the ground due to a lack of root development. Commercially available seed mixes are also available, but may be less desirable. Seed mixes often contain introduced types, do not allow for selection flexibility, and often suffer from weed invasion.

Follow the planting design, and be sure appropriate space is available for plant development. After planting, spread a thin layer of an organic mulch to restrict weed invasion, buffer soil temperatures, and reduce water loss. Water as needed until plants are established.

Maintaining the Bed

After the beds are established, maintenance activities are limited. Water only as needed to prevent wilting; during normal growing conditions, most of these plants will tolerate some drought. Fertilizer applications are rarely required if soils are of adequate natural fertility. Weeds should be hand-pulled or hoed until the prairie plants have completely covered the bed's surface. Dead head forbs after flowering to improve bed appearance and decrease seed movement into undesirable areas.

Questions regarding the need for burning prairie plants often arises. In areas where burning is both legally and safely possible, burn plants in early spring. Obviously, take care to ensure no damage occurs to adjacent areas. Where burning is not possible, cut plants to just above ground in early spring and remove the stubble for disposal.

We are fortunate to have a broad palette of ornamental plants for improving Midwestern enhancing the golfing experience. Grounds appearance can be made even more interesting by appropriately incorporating beds composed of native prairie plants into the golf course. Many prairie forbs such as black-eyed Susan, purple coneflower, coreopsis, and goldenrod can be easily combined with little bluestem, Indiangrass, prairie dropseed and other attractive grasses to produce beds that are singularly unique and spectacularly beautiful.
