The all-new Reelmaster[®] 5010 series fairway mowers from Toro deliver exceptional quality of cut and aftercut appearance. Dual Precision Adjustment (DPA) cutting units make adjustments simple and more accurate. The cutting edges stay sharp two to three times longer, resulting in less maintenance. Optional accessories further enhance performance. Call Reinders today and see how the hundreds of improvements will keep your fairways in championship condition.

The Midwest Association of Golf Course Superintendents (MAGCS), founded December 24, 1926, is a professional organization whose goals include preservation and dissemination of scientific and practical knowledge pertaining to golf turf maintenance.We endeavor to increase efficiency and economic performance while improving and enhancing the individual and collective prestige of the members.

The MAGCS member is also an environmental steward. We strive to uphold and enhance our surroundings by promoting flora and fauna in every facet in a manner that is beneficial to the general public now and in the future.

Please contact **Burris Equipment** for a **FREE** demonstration!

Our shatter knife technology creates new root growth with each use.

DIRECTOR'S COLUMN Ed Braunsky, Geneva Country Club

MAGCS Strikes Again

The Midwest Association of Golf Course Superintendents. Those words were heard a lot at the Golf Course Industry Show held in New Orleans back in February. Our Association has always been a huge part of the "biggest show on turf". Here are several examples.

Every year the MAGCS has one of the biggest voting blocks of all of the chapters across the country. This is very important due to the fact that our huge voting block helps to elect the best candidates each year. The annual golf tournament was held in the Gulf Shores, Alabama. The MAGCS had the most participants in attendance of any single chapter. Our association won the Team Championship. Tim Scott finished in second place in the championship flight. Overall, the numbers of participants were down but the Midwest still held form and performed well!

On Tuesday and Wednesday of the show a number of our members gave several hours of their time and "trade skills" towards a great organization. The aftermath of Hurricane Katrina left a lot of damage and devastation to the New Orleans area. Habitat for Humanity provided many MAGCS members a chance to help build New Orleans. I was involved in the process and would recommend this day of pitching in to all. There will be

a similar project in San Diego next year. I urge you to consider it.

How about the awards won by our members? Sam MacKenzie, CGCS was named the Superintendent of the Year by Turfnet. Way to go Sam! Dan Dinelli, CGCS was named the winner of the President's Award for Environmental Stewardship. The awards just keep coming for all of Dan's environmental work, and deservedly so. Dan you the MAN!

EARLY Friday morning gave all who wanted to attend a great way to start the day. For many years the Prayer Breakfast has been presented to give all a chance to recharge their batteries with a big dose of fellowship and worship. Many members of the MAGCS play a big part in not only planning this event but also participating in it. If you like "When the Saints Go Marching In" you missed out on a rousing rendition.

Last but not least, our Association hosted another outstanding Hospitality Reception on Thursday evening. 285 people attended "one of the best rooms yet", and many people are to thank. From Luke Cella to Sharon Riesenbeck to the all Commercial Members who donated towards this big night I say THANK YOU. Our Association's hospitality night continues to be one of the biggest and best!

By the time you read this, the Past Presidents will have met and already talked about many other accomplishments of the MAGCS. MAGCS continues to lead the industry because of all the great individuals that make our Association one of the best. I hope everyone has a great 2009 season. **-OC**

Existing Greens Drainage is a cost effective permanent solution that will revive poorly drained greens, tees and approaches leaving them in tournament condition in 2-3 days.

SUPER - N - SITE Virgil Range, Aurora Country Club

Tony Kalina, Eric Mundt, -N-Travis Dykstra

Prairie Landing Golf Club (PLGC) is an upscale 18-hole public golf facility located in West Chicago, Illinois, on the site of the historic 1868 McChesney Home. It is the only Robert Trent Jones Jr. design in Chicago's west suburbs to be named a "Five Star premiere golf experience." Construction started in 1990 by G. A. Blocker and Greenscapes, Ltd., and the course opened for play in July of 1994. Its amenities include a full practice range as well as two complete par 4 practice holes. Prairie Landing features undulating, wide fairways amongst a meandering waterway and dramatic fescue-covered mounds. Bunkering is extensive and strategic, and wind is a huge factor on the mostly open layout. The greens are relatively large, offering many challenging hole locations, and the five sets of tee placements provide a variety of yardages for all levels of expertise.

Golf Course Superintendent and MAGCS president, Tony Kalina, has been patrolling the grounds at PLGC since 1991. Because he has hosted previous MAGCS events and has been featured in this segment before, I am going to introduce you to two key members of his staff—assistant superintendents **Eric Mundt** and **Travis Dykstra**.

Eric Mundt was born 37 years ago in Aurora, Illinois. His immediate family is his girlfriend of 11 years, Stephanie, his 13-year old daughter, and their pet cat. Eric is a Joliet Junior College graduate with a major in Agriculture and Turf

Management. He began his career in golf course management as an intern for Jeff Brinegar at Rich Harvest Farms in 1999. Following that, he moved over to Medinah Country Club where he worked for Tom Lively. At Medinah, he was happy to have been a part of the course 3 renovation in 2003. In 2007, Eric came to Prairie Landing to work for Tony Kalina.

Eric's love of the outdoors and a deep respect for the game of golf were the keys in his choosing this career. He believes that golf's test of focus and mental fortitude are important traits to have in our profession. He carries an 8 handicap and loves playing at Prairie Landing, though he also has a soft spot in his heart for Fox Bend Golf Course where he played as a youngster. In

Eric Mundt and Travis Dykstra

addition to golf, Eric enjoys bicycling, running, fishing, woodworking, and following college football and hoops. His plans for the future include becoming a superintendent, marriage, more children, a bigger house (get one now they're cheap!), adding a dog to the family, and improving his golf game.

Travis Dykstra was born in Sibley, lowa and is 25 years young. He and his wife Brooke have 2 dogs—a black lab named Oakley and a German Shepherd mix named Bodhi. He graduated in May 2006 from lowa State University with a degree in horticulture and an emphasis on Turfgrass Science. Travis got his start

in the golf business at Sibley Golf and Country Club under superintendent Stephen Roseberry. He also gained experience at Veenker Memorial in Ames, Iowa and at the Yellowstone Club in Big Sky, Montana. He then moved to The Reserve at Moonlight Basin, also in Big Sky, before coming to Prairie Landing in 2007.

Travis started young in the business and has been hooked ever since. He finds pleasure in seeing golfers enjoying themselves on the course that he works so hard to prepare. Of the many difficulties he faces in his job, Travis feels that striving to be more efficient each day is one of the greatest challenges, especially in our current economy. His plans for the immediate (continued on page 6)

Prairie Landing Golf Course, with the striking clubhouse in the background, was one of the first links style courses to be constructed in Chicagoland in the modern era.

future are to build a house in Montgomery that he and Brooke will share for many years to come.

There are several planned upgrades and projects at Prairie Landing. These include the renovation of all bunkers and experimenting with *Poa annua* eradication on greens. Several new products and cultural methods are being tested, and the staff looks forward to the results this spring. Also in the plans are new irrigation satellites, cart path renovations, clubhouse improvements, and replacement of the entire fleet of golf cars.

Tony, Eric, and Travis look forward to hosting the April MAGCS meeting and hope for a big turnout. We thank them in advance for their generosity and hard work in preparing the course for us this month. **-OC**

FEATURE ARTICLE | Derek Settle, PhD, CDGA

USGA Foliar Product Evaluation for Greens Back to the Basics is a Good Thing

During winter 2007, I was involved in a phone conversation with the United States Golf Association (USGA) Green Section Staff and other turfgrass scientists. The topic at hand was whether more information might be needed with respect to 'spoon feeding,' a common liquid fertilization method utilized for sand-based putting greens. An idea from the USGA had just surfaced...and I was invited to be part of a team.

I was to help develop a protocol for replicated field experiment. This USGA study would establish a regular USGA product testing initiative. At the time, the view I expressed on the phone was that nitrogen levels in Chicago area had gotten lower than most had ever expected on golf greens. Fertility to promote healthy turf had given up some ground – and that ground was faster than ever before. That ground is known by golfers as the putting surface, which they simply call the green. The current issue is this: When greens aren't so green maybe they might become more prone to abiotic abnormalities during peak heat stress (e.g., midsummer decline) and experience more disease outbreaks (i.e., we have recent evidence that anthracnose basal stem rot gets worse - Uddin et al., 2009).

Today's fertility programs for golf greens must both compliment a superintendent's effort to provide plant health and provide adequate ball roll speed for golfers. As a result, foliar fertility and/or biostimulant programs that can and do allow judicious application of nitrogen have become increasingly popular. The question was..."How do we figure out which products to recommend to golf course superintendents?" Science would help provide that answer.

The Idea

The idea was that a head-to-head product test for foliar fertility of golf greens could greatly help golf course superintendents in their fertility decision making. This project was the brain-child of Jim Moore, USGA, who felt that liquid biostimulants were increasing in number and had not been adequately tested. He was right, and there continues to be limited data on how biostimulants influence plant health and disease outbreaks. Did someone say disease? So, I was teamed up with another plant pathologist, Dr. Peter Dernoeden, University of Maryland. Both Maryland and Chicago have similar cool and humid environments. We felt that the two sites would be complimentary in the study of both issues – health and disease. Both sites would follow exactly the same protocol. We aimed to test about six products that were common in the trade in the northern U.S. Region. If similar research results were obtained from both locations, it would strengthen the findings.

Trial and Error

In 2007, the first year of the study, we learned that the development of dollar spot disease was not greatly influenced by the products being tested. The levels of dollar spot we experienced were unacceptable for a green – infection center levels could quickly exceed 5% damage. Therefore, in 2008 we changed our direction, and controlled plant disease completely. We decided to make the USGA study focus solely on comparison of products to influence plant health. Plant pathologists would become plant physiologists. We would keep measurements simple, but valuable. Two aboveground plant health indicators were used, visual quality and an electronic method known as NDVI (normalized difference index). NDVI quantifies reflectance of red and infrared light from the turfgrass canopy. We expected both methods would provide similar results, but NDVI provides a useful tool because it is not subjective. Unbiased information on turfgrass health is sometimes necessary in order to aid in difficult decisions about golf green health, such as tree removal (Settle, 2008). In this case, NDVI provided a second opinion, an electronic eye's view of golf green health (chlorophyll levels). If in agreement, it would validate the visual (continued on next page)

7

quality ratings of a trained turfgrass scientist and bolster the results of both.

Defining a Biostimulant

Our aim was to test three commonly used foliar products thought to enhance green health. We included cytokinian plant extract biostimulants, iron, and nitrogen products. While the latter two represent macro-nutrients, cytokininians are plant hormones that have received increasing attention from plant physiologists. Biostimulant is actually a broad term that would define many ingredients on a 2.5-gallon jug's label.

Looking at a label you will find an ingredient list that may be long or short **(Figure 1)**. The list may include cytokinians, humates, nutrients, organic acids, hormones, vitamins, microbial inoculants, plant extracts, and more (Ervin and Zhang, 2008). Frequently, as it turns out, a biostimulant product can contain iron (Fe) and/or nitrogen (N). This fact has consequence because nitrogen effects are known to be the dominant player that stimulates plant health and growth. It makes it hard to understand the effects of most other biostimulants, when they are delivered in combination with nitrogen. In short, we know what nitrogen fertility does when applied to a green (i.e., bentgrass gets greener, denser, and grows longer). We can also 'see' the foliar effects of iron when microscopic metallic flakes paint leaf blades (i.e., a darker color occurs immediately).

Six Products Tested

In 2008, the summer quality of creeping bentgrass research greens in Lemont, IL **(Figure 2)** and College Park, MD was

Figure 1. Five products that were tested on research putting greens in IL and MD that contain cytokinians and other plant extracts, N, Fe, and/or various combinations of ingredients.

Figure 2. Dr. Mike Kenna, USGA's Director of Research, photographs field plots of biostimulant products on Sunshine Course's number 2 green in Lemont IL on 28 June, 2007.

monitored in response to six liquid fertilizer and biostimulant products and to urea **(Table 1)**. The products tested were Iron-Roots, Roots Concentrate, Knife, PanaSea Plus, Lesco's 12-0-0 Chelated Iron Plus Micronutrients (hereafter Lesco 12-0-0), Ultraplex, and urea. Three of these products did not contain nitrogen as a primary nutrient, so they were also mixed with urea. Those treatments were IronRoots + urea, Roots Concentrate + urea, and PanaSea Plus + urea. All products were tested at label application rates and intervals. All treatments were applied at a 14-day interval, except Knife which was evaluated, as the label recommends, at two rates either every 14 or 28 days.

Treatment and analysis urea = 0.15 lb N/14 days	Application rate/1000 ft ²	*Application cost Acre ⁻¹	Manufacturer	Additional micronutrients or other biostimulant (%) 0.05% B, 0.05% Cu, 2.0% Fe, 0.4% Mn, 0.4% Zn	
Ultraplex 5-0-3	6.0 fl oz	\$170.00	Grigg Bros.		
Iron Roots 0-2-4	2.0 fl oz	\$79.00	Novozymes	4.0%Fe	
Knife 12-0-0	1.5 fl oz	\$43.00	Floratine	4.0%S, 6.0%Fe	
Knife 12-0-0 28 days	2.5 fl oz	\$57.00	Floratine	4.0% S, 6.0% Fe	
PanaSca Plus 0-2-2	3.0 fl oz	\$151.00	Emerald Isle	Unspecified sea plant extracts	
urea 46-0-0	0.15 lb N	\$7.50	N/A	None	
Lesco 12-0-0 + Micros	4.0 fl oz	\$29.00	Lesco	4.0% S, 6.0% Fe, 2.0% Mn Chelated Iron + Micro	
Roots Concentrate 0-0-0	2.0 fl oz	\$43.00	Novozymes	4.6% humic acids, 3.9% kelp extract, 3.0% vitamin C, 1.0% amino acids, 0.5% myo-inositol, 0.3% vitamin B ₁ , 0.1% vitamin E	

Table 1. Products evaluated in IL and MD on creeping bentgrass research greens in 2007 and 2008.

Treatment and analysis ranked by AUC values	Rate 1000 ft-2	* 10 Oct visual quality	y AUC visual quality	Percent dates (> 6) with acceptable value
Iron Roots 0-2-4 + urea	2.0 fl oz	*8.5 a	130 a	15 of 15 = 100%
urea 46-0-0	0.15 lb	8.5 a	129 a	15 of 15 = 100%
PanaSca Plus 0-2-2 + urea	3.0 fl oz	8.5 a	127 a	15 of 15 = 100%

Roots Concentrate 0-0-0	2.0 fl oz	4.8 c	76 d	0 of 15 = 0%

Area Under the Curve summarizes 15 visual quality rating dates from 24 Jun to 10 Oct.

Column means with the same letter are not significantly different according to Fisher's LSD, P < 0.05.

Table 2. The season summary for visual quality of foliar products evaluated on a bentgrass green in Lemont, IL, 2008. Final rating date was 10 Oct and last application occurred on 3 Sep.

Materials and Methods

Both study sites used preventive fungicides every two weeks at label rates to control dollar spot (*Sclerotinia homoeocarpa*) and brown patch (*Rhizoctonia solani*). Chemistries that were rotated included Chipco 26GT, Daconil Ultrex, or Emerald. The studies were conducted on mature stands of 'Penn G-2' + 'L-93' in Lemont (hereafter IL) or 'Providence' in College Park (hereafter MD). The research greens were mowed five to six times weekly to a height of 0.156 inch. Other than for greenup, at no time during 2008 did supplemental fertilization occur. The IL site received 0.5 lb N/1000 ft² during May 2008 and the MD site received 1.75 lb N/1000ft² between April and May, 2008. Treatments were applied in 50 (MD) or 87 (IL) gallons per acre of water using a CO2 pressurized backpack sprayer equipped with two 8004 Tee Jet flat-fan nozzles. Plots weredata showed best color/chlorophyll levels were provided by urea alone or when urea was mixed with another product in the test.

4 ft by 6 ft (IL) or 5 ft by 10 ft (MD) and arranged in a randomized complete block with four replications.

Turfgrass color and quality were assessed visually on a 0 to 10 scale where 0 = entire plot area brown or dead; 7 = minimum acceptable color and quality; and 10 = optimal greenness, texture and uniformity. Color and chlorophyll levels were estimated using normalized difference vegetation index. The small NDVI device that captured percent reflectance of red and nearinfrared wavelengths from the turfgrass canopy **(Figure 3)** was a Field Scout TCM 500 Color Meter (Spectrum Technologies Inc., Plainfield, IL).

Figure 3. NDVI was used to capture light reflectance of red and near-infrared wavelengths to quantify chlorophyll content of a bentgrass green.

Results

Very similar results were obtained at both IL and MD with respect to urea. Suffice it to say, Dr. Dernoeden noted at study conclusion that near-identical results at two sites is "rare." Though we had expected to see similar trends, the research project was more successful than we had anticipated. Plant health data was limited in 2007. In that year we were focused on investigating disease suppression. NDVI in IL showed urea had a positive impact on plant health compared to other treatments. Using NDVI, which allowed avoidance of dollar spot infection centers, data showed best color/chlorophyll levels were provided by urea alone or when urea was mixed with another product in the test. Surprisingly, using NDVI comparisons, no other treatment in the study fared better than the untreated control. In 2007, the season long NDVI average represented 20 dates from 3 July to 13 November. Treatments similar to untreated were Ultraplex, Lesco 12-0-0, Knife, PanaSea Plus, and Iron Roots. (continued on next page)

9

The following year, similar results were found in IL. Highest NDVI levels again were measured with urea alone or urea in combination. In 2008, the season average represented 15 dates from 24 June to 10 October (Figure 4). We also compared results in IL and MD based on visual quality, and found that urea had provided best plant health in both locations (Figure 5). Looking at weekly measurements of plant health in IL, the effect of urea was obvious (Figure 6). In fact, where visual quality ratings showed optimum plant health, the positive effect of urea lasted the entire season (Figure 7). The line graph also shows that 'spoon feeding' low amounts of urea, 0.15 lb N/1,000 ft² every 14 days, provided a relatively smooth level of visual quality.

Figure 4. NDVI for all treatments when data were averaged over the 2008 season in IL.

Figure 5. Visual quality ratings for all treatments when data were averaged over the 2008 season in IL and MD.

Figure 6. Weekly measurements of visual quality on a bentgrass green in Lemont, IL during 2008.

Figure 7. Residual effect of treatments in IL on visual quality when rated 10 October with last product application was 3 September, 2008.

A Lesson Learned

As one of two plant pathologists given the task of a headto-head evaluation of several popular biostimulants and/or iron and of nitrogen products for their effect on bentgrass greens...I had learned a lot. The study provided strong evidence that there are ways to save money without sacrificing plant health. In fact, it appears that a return to urea as the primary source of nitrogen may actually improve plant health compared to the plethora of other products sometimes simply called biostimulants. As planned we had gathered plant health information from two regions - Chicago and Maryland. This suggests that urea will provide a beneficial effect for bentgrass greens in the northern U.S. region. This is real world stuff. We had used nitrogen rates that would accurately reflect current golf green fertility practices. A survey of Chicagoland Golf Course Superintendents in March of 2006 indicated that, for the season, most golf greens are limited to no more than 3 lbs of nitrogen.

Fast Forward and Back to Basics

Fast forward to 2009, declared a recession year by economists the world over. At educational meetings the talk is of "going back to basics." To me that means that we need to play our cards conservatively, we need to use our skills, our experience, and our training in the field of turfgrass science to save money. I was attending a Superintendents meeting earlier in March and heard comments by David Fearis, GCSAA Director of Membership, that were helpful. In his presentation he spotlighted the gcsaa.org website. He showed a tool that had recently been developed for the website. Several articles had been collected for reference. The tab on the pull-down menu was labeled "Economic Survival Kit." Of the dozen or so articles available online, one struck me as especially useful. The article's title was simply "Budget Crunch," and was written by David Oatis, USGA Director for the Northeast Region, on December 1, 2008. It is current information to help us during tough economic times. In the two page article he states, "So, where can dollars be cut from the budget? Perhaps the more important question is: where can corners NOT be cut? A key in working through your budget dilemma is to go back to basics." As I looked at David's nine points that might help save money... there it was, second from the end...point number 8. It read:
