(Continued from page 50)

ferent from the no preparation or verticut treatments. Thus, only at 3 wk after overseeding was there equivalent cover on plots not receiving topdressing as part of the treatment. Similar trends were noted throughout the experiment period until the last evaluation on 24 March. Averaged over the study period, topdressed plots had higher percent cover ratings.

Turf quality ratings, which subjectively combine color, texture, density, and uniformity, closely followed the percent cover ratings (Table 2). Turf quality was greatly improved by topdressing at the first evaluation on 22 November and was consistently higher for the topdressed treatments through November although there was no difference between topdressed plots and the no preparation or verticut treatments on 29 November. Evaluations during the remainder of the study indicate that topdressed plots had high turf quality ratings.

Ball roll data taken 10 days following overseeding indicated the sandwich treatment in the north direction had a lower length of roll (Table 3). The mean over both directions indicated no differences in ball roll lengths among treatments. Thus topdressing did not significantly slow ball roll. According to USGA Green Section standards experimental treatments would rate in the medium-slow

Table 3. Measurements of the effect of various overseeding establishment treatments on golf ball roll.

		Ball Roll Lengths ^z			
Overseeding treatment		North	South	Mean	
			cm		
No preparation		183 ау	183 a	173 a

ball roll category. This can be attributed to the stage of transition of the overseeding and partially due to the 6 mm mowing height. But overall turf quality on the topdressed plots was excellent even though temperatures were higher than average through December and some bermudagrass growth persisted almost until January.

Conclusions

Topdressing after seeding or sandwiching the seed between 2 layers of topdressing produced the highest percent cover and best turf quality during the initial establishment period. One week following overseeding, topdressed plots had 4 to 5 times more turf cover than any other treatment. This advantage in germination rate persisted for the first month. Percent cover ratings were not different between the single topdressed and double topdressed (sandwich) plots. Thus there appears to be no benefit from the added work of double topdressing or sandwiching the seed. Ball roll data indicated no differences among treatments at 10 days after overseeding. Therefore topdressing after seeding benefited seedling establishment without notable affects on ball roll performance.

Guest Editorial

By JOE SNOOK Riverbend Country Club

One by one, our pesticides are being confiscated by a bureaucratic system which seemingly feels that we should all suffer because of the misuse by a small number of applicators.

Why are our elected officials and government employees not following their guidelines and existing laws? (The Florida Department of Agriculture recommended the excessive rates of EDB as a buffer treatment in citrus groves — more than 10 times the highest rate indicated on the label!) Golf course superintendents were advised during pesticide licensing of a fine of \$25,000 and a prison term of up to one year for knowlingly misusing a pesticide.

The headline in local newspaper, as some of you may have already seen, stated "EDB Ban Is a Mistake". Quoting from that article, "We are concerned that the decision to ban EDB is based on the momentum of hysteria and is not scientifically based" said Dr. Elisabeth Whelen, Director of the American Council on Science and Health. Dr. Milton Ovye, National Coordinator for the U.S. Department of Agriculture said that he believes banning EDB was imprudent. He stated, "EDB isn't even in the same league with cigarettes"!

If enough pressure is exerted by the Florida G.C.S.A. and G.C.S.A. along with an edict for a change of the political boondoggling we have grown accustomed to, perhaps we can retain and have returned to us that which is rightfully ours. I have advised my representatives, both state and federal, of my feelings concerning total banning of pesticides without total regard of all segments affected. The next time you receive a questionnaire from your congressman, please take the time to express our concern on this matter. Hopefully, we can put an end to the massacre of our valued chemicals.

When you're looking for a real investment

We'll guarantee more than most.

Contact your nearest Ransomes distributor for a demonstration. In South Florida: Ransomes Florida, Inc., 1-800-321-8374. In North Florida: Turf & Industrial Eqt. Co., 305-327-2220.

RANSOMES

When you have large urban grass areas to maintain, the **new Motor 350 D** from Ransomes really comes into its own.

With a cutting width of 11'6", the five big diameter Magna cutting units give you a highly productive work rate.

And it's all hydraulic — the drive and lift to the cutting units, plus the drive to the ground-hugging front wheels.

All this from a diesel powered ride-on gang mower that offers exceptional fuel economy.

It's not surprising that such an exceptional mower carries with it more of a guarantee than most — a full 12 months for professional usage.

Ransomes build mowers as carefully as you choose them.
