Siena College study

Continued from page 3

defining what species are present and their level of diversity. This will be performed from 1995-97. "A golf course habitat could potentially attract a different species than if the land were not managed," Woolbright said. "One of our goals, then, is to increase native species of plants and wildlife."

• Long-term monitoring of populations and processes, like stream flow and chemistry, to determine the effects of management practices. "We need to look specifically at water chemistry changes during times of application. We will work very closely with Schuyler Meadows to time our studies with their management practices," Woolbright explained.

• Experimental manipulation, beginning in 1998. "Once we know everything that is there, where it is and how it reacts to management practices, we could recommend alternatives and methods we think would have a beneficial effect," Woolbright said. "And we would measure the effects of changes in those practices."
