## How Long Are Drives of Tourney Golfers?

## By THOMAS McMAHON

L ENGTH of a golfer's drive and the length and weight of the fisherman's catch present constant and interesting differences between fiction and fact. To appraise the facts of drives I had the assistance of Ralph Modica and Tracy Turner, members of Edgewater GC, in measuring the carry and roll of drives made during the Chicago District GA's Victory Open.

First reaction of the golfer studying the returns is that there might be some differences accounted for by pre-war and remade golf balls. However, expert judgment is that the usual effect of time on rubber, regardless of conditions under which the pre-war balls were kept, would virtually equalize performance of the two types of balls. Probably fresh new balls would have somewhat greater length, but you can think about that when the war's over.

The Edgewater fairways were watered. Wind direction and velocity were checked during the teeing off periods for each of the four rounds of the major event. The first hole, on which the measurements were taken, is practically flat, running from east to west. The tee is elevated approximately five feet. The wind direction on Friday and Saturday was northeast; Sunday morning and Sunday afternoon southeast. There was a variation in wind velocity. Velocity ranged from 6 to 10 miles an hour.

The longest average carry and roll, 275 yards, was made by Craig Wood. The longest individual drive, carry and roll was 285 yards; a tie between Craig Wood and Bob Hamilton.

The longest average carry was 248 yards; a tie between Byron Nelson and Sam Byrd. The longest individual carry was 255 yards; a tie between Byron Nelson and Sam Byrd.

The average for the 180 drives recorded for carry and roll was 249 yards, carry only 224 yards, roll only 25 yards.

only 224 yards, roll only 25 yards. A review of the figures indicates that Byron Nelson's four drives were more consistent than any of the other leaders. An average roll of 22 yards, against an average roll for Craig Wood of 43 yards, indicates that Craig's drives have more top spin on them.

Summary of the results:

Longest drive — carry and roll, 285 yards, Craig Wood and Bob Hamilton.

August, 1944

Longest carry only — 255 yards, Byron Nelson and Sam Byrd.

Longest roll — 63 yards, Dale Morey.\* Longest drive — carry and roll average,

275 yards, Craig Wood. Longest carry only—average 248 yards, Byron Nelson and Sam Byrd.

Longest roll — average 43 yards, Craig Wood and Bill Hyndman.\*

Shortest roll, 2 yards, Johnny Lehman.\* Shortest roll — average 13 yards,

Shortest roll — average 13 yards, Harold McSpaden and Willie Klein.

Average — carry and roll for entire field, 249 yards.

Average — carry only for entire field, 224 yards.

Average — roll for entire field, 27 yards.

The variation in the various rolls was caused by the type of shot played and difference in hardness and slope of turf where ball carried.

Figures on the driving of several notables are especially interesting. Four round data on the stars follows.

## Greenkeeper Considers Design of Postwar Equipment By EMIL MASHIE

Golf Course Supt., Onwentsia Club

NOTWITHSTANDING the crowded schedule under which greenkeepers work these days many of them are giving thought to design and construction desirable in postwar equipment. Possibly some of this thought is prompted by the acquaintance with machinery design and performance which has been enlarged by wartime jobs. In my own case I start at the course at 6:30 A.M. or before and am in a machine shop of a metallurgical company from 3:30 P.M. until midnight.

Such a program, requiring intense study of means of conducting golf course maintenance operations with speed, economy and continuance of good playing condition, together with opportunities of observing close-up the methods of a very efficient industrial plant, is bound to have an effect in making one think about what improvements could be made in course maintenance machinery.

At Onwenstia we have had less power

equipment than I think we'll consider essential after the war. Prior to the war we were able to rely on manual labor to handle work that motorized equipment could do.

Like many others responsible for golf course condition I believe I have some definitely practical ideas of what will have to be done by motorized equipment after the war. Possibly some of my opinions and hopes are too visionary, but I believe them to be well founded.

First, regardless of type of equipment one is to favor, lighter equipment, especially green mowers is desirable.

On greens it seems that about 21-inch mower is the maximum that can be used practically. How about designs along the lines of fairway gang mowers, maybe three small mowers? How about two or three flexible reels as one larger unit? Personally, I like a single unit mower for greens—but the gang mowers accomplish the work faster. I have thought of units of two or three that can be used as such or separately. There is no question that with lighter mowers increased efficiency and improved turf will be attained.

In the rough mower field, there is need
