Product Q&A

Q: Why should a superintendent visit the Turfco booth?

A: Turfco Manufacturing is offering an in-depth look at its TriWave 60-Inch Overseeder, a new machine that can significantly increase overseeding success, especially on contoured terrain.

Q: Why do superintendents need your product?

A: Turfco created the TriWave 60-Inch Overseeder to address problems superintendents have traditionally faced with the overseeding process. From disruption of existing turf, to the inability to follow terrain contours, or the limited seed germination that was being achieved, existing designs weren't successful.

Q: What makes your product unique?

A: Turfco developed five major technological advancements that contribute to improved seed germination and minimal disruption to existing turf. Turfco set the blade spacing at 1½ inches for greater seed density. Blades are mounted on three, 18-inch wide, patent-pending independent floating seed heads that precisely follow ground contour for consistent seed placement depth. The TriWave delivers more effective seed placement with reduced turf damage from patent-pending WaveBlade™ technology and a patent-pending seed delivery system. WaveBlade technology uses powered, counter-rotating blades to create optimum clean slits for improved seed-to-soil contact while minimizing turf disruption. The seed delivery system places seeds directly into slits without waste for increased germination, and Turfco's patent-pending infinite depth adjustment allows easy adjustment of seed depth on-site, without tools.

Q: What are superintendents saying about your product?

A: They're saying that the TriWave 60-Inch Overseeder allows them to seed more successfully over a wider variety of terrain, with far less disruption to existing turf.
