

NO MILORGANITE

MILORGANITE

IS FALL FEEDING WORTH WHILE?..

GRANULAR
No Dust

Easy, safe to apply—even on windy days—Does not harden or cake in storage.

STRICTLY ORGANIC
Long Lasting

Uniform, continuous release of plant food, over long periods—assures uniform and continuous turf growth.

LARGELY WATER INSOLUBLE
Safe To Use

Simply apply uniformly—then no danger of burning. Residual plant food lies dormant during winter, does not leach from soil.

Most clubs no longer question the necessity for fall feeding. They know by actual experience that fall fertilization, rather than extensive re-seeding is the secret of healthy fairways, the positive and economical way to assure better turf next season.*

Lower Seed Cost — Dense Turf — Fewer Weeds

Because Milorganite is largely water insoluble, and strictly organic, it is the safe and ideal fertilizer for fall use. No need to worry about the possibility of unsightly burned fairways if Milorganite is selected. Soil processes release its plant food slowly, in sufficient quantities to stimulate fall growth. The residual nitrogen, instead of being lost by leaching, remains dormant in the soil, ready to nourish the grass as soon as soil micro-organisms renew activity in the spring.

**In regions where crab grass is a major problem, a generous application of Milorganite this fall will increase turf density and minimize crab grass infestation next season.*
