

in the Spring ... in the Fall

The Milorganite method of application has made history. It expresses the height of simplicity, offers complete freedom from the expense and bother of careful, measured, frequent applications necessary with some fertilizers. "Once"—not every other day, not every week, not twice a month, but "once", in the spring; once, in the fall.

The only care necessary in applying Milorganite is to spread it evenly, to avoid dumping in piles. When this ordinary care is exercised, usually a sufficient quantity can be applied at ONE time to last through the entire growing season.

This is because Milorganite is a natural, organic fertilizer, largely water insoluble, long lasting.

Over ten years of uniformly successful results in all parts of the United States and Canada, on all soils, in all climates, in wet or dry seasons, make Milorganite the outstanding turf fertilizer.
