

"I Stimped Once This Year.

...And they were 9.5 with dew on them.
So, I don't worry about green speed."

"Penn A-4 gives me the luxury of doing things the way I want. I don't do any more maintenance than I did with Penncross, and my greens are consistent, smooth and true. In fact, with Penn A-4, I find the less you do, the better it is."

David Riedman, Golf Course Superintendent
Woodland Country Club, Carmel, Indiana

Green speed data from the NTEP / USGA / GCSAA on-site creeping bentgrass trials have shown that stimpmeter readings are independent of grass variety.

It's not the grass that determines speed, it's how you manage it.

The Penn A's and G's are so adaptable, you can easily adjust your green speed up or down, without sacrificing plant health, for consistent quality putting surfaces, no matter what.

And for extra credit, the A's and G's have proven to crowd out *Poa annua*, even during *Poa*'s peak growing season.
