

Creeping Bentgrass—

(Continued from Page 11)

trace amounts of disease (<2% Fusarium patch on both application dates). Applications of Insignia alone, Chipco 26GT + TADS12529, or TD2390 resulted in disease development that was commercially unacceptable. No phytotoxicity or other quality differences were observed in any of the plots. There were no significant differences in disease development at the two application dates with the exception of plots treated with TD2390.
