

Nine Ways to Highlight Water Savings in July

The Irrigation Association declared July Smart Irrigation Month to draw attention to advances in irrigation efficiency and to the skilled professionals who use irrigation to make the world greener with less water. Here are nine steps you can take in recognition of Smart Irrigation Month to let your community know your facility is a good steward of water resources.

1. Write an article about the importance of water conservation and your efforts for a local newspaper, newsletter or magazine. Offer tips for the homeowner or other turf managers based on your professional training and experience.

2. Remind local newspaper, radio and television stations about Smart Irrigation Month and offer yourself as a source for information on efficient water use. If there's no immediate interest, let the reporter or editor know you're willing any time to be a source for articles on water conservation.

3. Take irrigation classes and earn an irrigation certification. Post certifications along with information about how certification demonstrates your knowledge and commitment to using resources efficiently.

4. Offer incentives for employees to take classes or earn Irrigation Association Certified Landscape Irrigation Auditor or Cer-

tified Golf Irrigation Auditor and conduct regular audits of your irrigation system.

5. Invite middle school or high school math or science students to your facility to assist with an audit. Explain how an audit helps you identify issues that could lead to water waste and let them put their math and/or data gathering skills to work on a real-world problem.

6. Offer to share your expertise with a local garden club, homeowners association or service group.

7. Use the SIM logo and consumer link, www.smartirrigationmonth.org, on correspondence, including e-mail, during July to raise awareness. The logo and other resources are at www.irrigation.org/SIM.htm.

8. Post information about irrigation efficiency on your website and in a visible location on your grounds. Include fact

sheets with information about how much water it takes to keep your facility green and steps you take to ensure water is used efficiently.

9. Post photos, a slideshow or a video of an irrigation audit in progress with an explanation of how audits help you identify and correct problems to keep your irrigation running at optimum efficiency.

The Irrigation Association promotes efficient and effective water management and acts as the voice of the irrigation industry. For information on irrigation classes or certifications, visit www.irrigation.org, write news@irrigation.org or call 703-536-7080. ♦

REIST INFIELDER

72" width • Floating clod breaking pulverizer roller & leveling bar • 6 section packer roller, reduces skidding during turns & comes with a **5 YEAR WARRANTY**
 Also features the first in spring loaded wing brushes
OPTIONAL 48" width available & tow hitch with adjustable wheels
 The **BEST WARRANTY** in the industry.

REIST AERASEEDER

Comes in widths of 48", 72" & 96"
 With the largest seed box capacity
 The 72" will give you over 1700 perforations per square yd • The base unit comes with front cone spike or knifing tine roller and a solid rear packer roller
 Seed is distributed through our ground drive mechanism
OPTIONAL rear cone spike or knifing tine roller

Visit our website www.ReistIndustries.com
 to preview a video presentation of our equipment.

TURF TRADES

Employment Bulletin Board @
www.sportsturfassociation.com

Are you advertising a position? Are you searching for a job? Target your audience or refine your search with **Turf Trades**, an online resource for all staffing levels and areas of the sports turf industry. Employment Bulletin Board ads run for 60 days with an additional 30 days available at 1/2 the price. Cost is \$75 for STA members and \$100 for non-members for the initial 60 day period. Payment by cheque (Canada only), MasterCard or Visa must accompany the job description.

2nd WATER WORKSHOP

Proactive Water Management for *Sports Turf Managers*

Following the success of our inaugural Spring 2006 workshop, the Sports Turf Association hosted a second *Proactive Water Management for Sports Turf Managers* full day event on March 29, 2007. This workshop addressed the implementation of water use bans and restrictions and the resulting concern for those responsible for premium field conditions for many sports such as soccer, football and baseball. It brought together those involved in managing the water supply of a municipality in the best interest of its citizens and those responsible for the management of quality sports turf surfaces for use by its citizens. Sessions were organized beginning with a more generalized view of the water management issue progressing to more specific, practical topics for use by turf managers. The following summary articles have been provided by our speakers and we extend our thanks to them for their further participation.

WORKSHOP SUMMARY

ROB WITHERSPOON, DIRECTOR, GUELPH TURFGRASS INSTITUTE

The key issues that poured out of the water management workshop were the increasingly complex regulatory environment surrounding irrigation water use, the need for improving water use efficiencies and the development of best management practices for irrigation system management.

Not a single participant at the workshop was working in a municipality that does not have some form of water use bylaw. A challenge facing sports turf managers is making the various forms of bylaws work for a sports field environment. A system that allows professional field managers to make application timing decisions within a restricted water use situation would make best use of a limited resource. Rather than applying water based on some arbitrary calendar and/or street address criteria, water should be applied in a manner that is appropriate for turf growing conditions. Many managers feel it would be better to have a fixed allocation of water each year to be applied as needed rather than working within a day of the week and/or street address system that is effective

for communicating with homeowners, but not particularly suited to the grass plant's needs.

As water restrictions increase, there appears to be a movement towards looking at alternatives to irrigating with treated municipal water. Some properties lend themselves to the construction of on-site irrigation ponds that may provide more flexibility with regards to water use. Capturing on-site runoff is one thing, but if plans call for tapping into an existing stream as a water source, extensive regulations apply including the need to develop a bypass pond and maintain a minimum stream flow. Although not discussed in detail at the workshop, waste water recycling systems that incorporate sports fields may be worthy of future investigation.

Efficiencies in water application are critical for sports turf managers to make best use of this critical resource. Regular auditing of system performance, knowing soil conditions and using some form of water budgeting all contribute to ensuring that water is being applied in an effective and logical fashion.

What's Inside WORKSHOP SESSIONS

The Protection of Our Water Resources: A Conservation Authority Perspective
Bob Edmondson, Director, Watershed Management Services, Conservation Halton

Water Efficiency in Halton Region
Wayne Galliher, Water/Wastewater Outreach Coordinator, Halton Region

Establishing a Water Use Baseline
Gregory Snaith, President, EnviroIrrigation Engineering, Inc.

Use It or Lose It: Best Management Practices for Water Management on Sports Fields
Pam Charbonneau, Turfgrass Specialist, OMAFRA

The general consensus of workshop participants was that water restrictions are an inevitable component of managing sports turf in the 21st century. The key to success is being an efficient water user and communicating with policy makers to ensure that water use restrictions conform with best management practices for water conservation in field management. ♦

THE PROTECTION OF OUR WATER RESOURCES

A CONSERVATION AUTHORITY PERSPECTIVE BY BOB EDMONDSON, DIRECTOR, WATERSHED MANAGEMENT SERVICES, CONSERVATION HALTON

Conservation authorities, particularly in the Greater Toronto Area, are known to most people for the conservation areas and large tracts of lands that they own and manage for outdoor recreation and education programs. In reality, the formation of conservation authorities came about with the passing of the *Conservation Authorities Act* in 1946 in response to concern expressed by agricultural, naturalist and sportsmen's groups "that all the renewable natural resources of the province were in an unhealthy state." The passing

of the Humber watershed in Toronto. Approximately 81 deaths were attributed to Hurricane Hazel and some 4,000 people left homeless. The damage was put at approximately \$1 billion in today's dollars. The significance of Hurricane Hazel is that it is the storm event that is used in today's standards in dealing with floodplain issues and the protection of life and property.

Hurricane Hazel served as an added initiative for municipalities to join and request the province to form a conservation authority as they were looked at as the ideal agency to deal with flood management on a watershed basis. Today there are 36 conservation authorities across Ontario.

Each conservation authority that was formed prepared a *Conservation Report* on the state of their watershed(s) that looked at flood management issues, the health of the watershed, opportunities for reforestation, recreation and land acquisition. In fact, most of the large tracts of land that are owned by conservation au-

thorities today were originally identified from these early reports that were done in the 1950s and 1960s. These early reports also looked at opportunities to protect life and property through flood management schemes that controlled flooding and erosion. This entailed the identification of sites for reservoirs to control flood flows and channelization projects to divert flows from susceptible areas or control erosion. As a result, significant investment was made in this type of structural

approach to flood management that took place throughout the 1960s and 1970s. Examples in the Conservation Halton watershed include the construction of the Kelso, Hilton Falls and Scotch Block dams and reservoirs on the Sixteen Mile Creek and the Mountsberg dam and reservoir on the Bronte Creek. Diversion channels were built in Oakville and Burlington to alleviate flooding in core areas of these centres. A channelization project in Milton was built to control the flows from the Sixteen Mile Creek and alleviate erosion through the downtown core.

Flood Damage Reduction Program

Later in the 1970s a regulatory approach was taken to deal with development within floodplains. Regulations were enacted by conservation authorities through the *Conservation Authorities Act* dealing with construction within floodplains, alteration of watercourses and the filling of valley systems and wetlands. Regional storm events were used as the regulatory storm event, which in the case of most of Southern Ontario is the Hurricane Hazel event that occurred over the Humber Watershed in 1954. In the early 1980s the federal and provincial governments sponsored the *Flood Damage Reduction Program*, which involved the mapping and delineation of floodplains by

Hurricane Hazel, 1954

of the Act provided the means by which the province and municipalities could join together to form a conservation authority within a specified area – the watershed – to undertake programs for natural resource management. A conservation authority is basically a community-based agency formed on a watershed basis in partnership with its municipalities and the province to deal with resource management issues that cross municipal boundaries.

Many of the earlier conservation authorities were formed to deal with resource management issues such as large reforestation initiatives within their watersheds. Most, however, came into being following Hurricane Hazel which found its way into the Province of Ontario in October 1954 resulting in significant loss of life and property damage, particularly within

Artificial Intelligence Artificial Intelligence Artificial Intelligence

A new range of professional artificial turf care machines have been developed by Redexim Charterhouse. Known worldwide for their reliable and effective range of natural turf care equipment such as the Verti-Drain®, Redexim Charterhouse has produced a complete range of equipment to meet the challenging needs of the artificial turf market.

Verti-Brush

The Verti-Brush quickly and effectively levels and distributes applied or existing infill with powerful hydraulic brushes.

Verti-Top

The Verti-Top employs a highly effective synthetic rotary brush to remove debris and top layer infill from the turf, then sifts the debris out in a unique vibratory shaker which redistributes the clean infill back on the field.

Verti-Broom

For brushing and striping of artificial turf, nothing beats the proven Verti-Broom. The highly effective triangular arrangement of the brushes will straighten and groom each grass blade for an attractive and realistic finish.

Verti-Groom

To brush, loosen and decompact the hardest infill, the Verti-Groom is equipped with a variety of interchangeable tools.

Verti-Air

The Verti-Air utilizes a rotary brush and turbine compressed air to lift all material out of the turf, dry and filter the material, sift out the debris and return the clean, dry and decompact infill back into the turf.

conservation authorities based on the regulatory storm. In effect, the intensity and duration of that storm event is transposed over a watershed to determine the extent of flooding that would occur in that watershed during that storm event. Development is prohibited or discouraged from taking place within that flood line. This approach by the province, in restricting development within the floodplain has been borne out in comparisons between significant storm events in Ontario and other jurisdictions. A well documented study comparing flooding in Ontario and Michigan found that although Michigan sustained extensive damage and suffered loss of life, Ontario had, during that same time period, higher flood yields. Even though Ontario's yields were higher the province recorded a small fraction of Michigan's damages. The difference in damages was estimated to be approximately \$500,000 in Ontario compared to \$310,000,000 in Michigan.

Controlling Development

The Province of Ontario through the *Provincial Policy Statement* identifies the importance of restricting development within floodplains and hazardous lands through Part 3 of the policy statement dealing with Natural Hazards. Conservation authorities represent the provincial interest in matters of natural hazards at the local or municipal level in dealing with development applications.

A conservation authority's regulation for flood plains and fill-regulated areas (e.g. valley lands and wetlands) also deals with the control of pollution and conservation of land as they may be affected by development. Conservation of land within the context of a conservation authority regulation includes preserving the ecological integrity of, for example, a valley system.

Changes to the *Conservation Authorities Act* in 1999 resulted in the development of a *Generic Regulation* to be used by all conservation authorities to ensure more consistency among their individual regulations. In May 2004, the Province of Ontario enacted *Ontario Regulation 97/04* entitled, "Development, Interference with Wetlands & Alterations to Shorelines and Watercourses Regulation." This provides for the regulation of all wa-

tercourses, either permanent or intermittent, floodplains and meander belts (of watercourses), erosion hazards, shorelines, wetlands and associated lands and other hazardous lands (e.g. areas of karst topography). Conservation authorities had two years to bring their individual regulations into conformity with the *Generic Regulation*, which each conservation authority in the province has done as of May 2006.

Changes to the Act and the implementation of the *Generic Regulation* and the

A watercourse does not have to contain fish in it to be considered fish habitat or have permanent standing water. An intermittent watercourse that does not have fish in it yet contributes a food supply to fish is considered fish habitat.

associated individual conservation authority regulations have essentially placed all natural hazards as identified in the *Provincial Policy Statement* under the regulations of a conservation authority. Development taking place within an area regulated by a conservation authority requires permission from that conservation authority. Violations of the regulation can result in fines of up to \$10,000 or three months in prison. Further, judgments can result in significant restoration costs.

The regulations, in addition to protecting against natural hazards, also allow for the protection of watercourses, valley lands and wetlands. Coupled with this are watershed studies undertaken by conservation authorities to identify restoration initiatives and opportunities to protect and enhance watercourses, valley lands, wetlands and other natural heritage features and to look at strategies for natural heritage systems that should be protected for the long term.

Protecting Fish Habitat

Conservation authorities have also formed partnerships with other agencies for the protection of natural features and habitats. This includes the signing of Memorandums of Understanding with

municipalities to provide expert advice on development applications as they may affect natural heritage systems and the signing of agreements with the Department of Fisheries and Oceans to protect fish habitat. Conservation authorities take an active role with their municipal partners in developing subwatershed studies and implementing recommended strategies as lands are urbanized.

The *Federal Fisheries Act* has become much more prominent in the last number of years in protecting fish habitat that may be affected by development. It should be noted that the Act is not new as it was first passed in 1868. Most conservation authorities have formed partnerships through agreements with the Department of Fisheries and Oceans to screen development applications for impacts to fish habitat with the guiding principle of no net loss to fish habitat. What is important to understand is the definition for fish habitat within the *Federal Fisheries Act*:

"Spawning grounds and nursery, rearing, food supply, migration and other areas on which fish depend directly or indirectly in order to carry out their life processes."

A watercourse does not have to contain fish in it to be considered fish habitat or have permanent standing water. An intermittent watercourse that does not have fish in it yet contributes a food supply to fish is considered fish habitat. Section 35 (1) of the *Federal Fisheries Act* prohibits the harmful alteration, disruption or destruction of fish habitat (HADD) without authorization by the Department of Fisheries and Oceans. Contravention of Section 35 (1) may result in a fine of \$1,000,000 and three years in prison.

Low Water Response Teams

Most conservation authorities have developed well-rounded programs over the years in caring for the health of their watersheds through restoration initiatives; acquisition of significant natural heritage areas; provision of open space recreational opportunities; stewardship initiatives with private landowners; providing assistance programs to landowners; establishing environmental monitoring programs; key messaging to the public on environmental

Flood Control Then

Flood Control Now

Intake Solution, Sample 1

Intake Solution, Sample 2

matters; advocating for environmental initiatives and implementing specific programs to address the needs of their watersheds.

An example of specific watershed programs includes the development of local *Low Water Response Teams* by most conservation authorities to deal with drought conditions within their watersheds. The programs were developed from measures undertaken by the province in the late 1990s in response to low precipitation. The programs are basically voluntary in nature to initiate actions to address low water conditions in streams or rivers and groundwater tables. The programs use indicators of precipitation and streamflow measured against normal averages. Three different levels of conditions are considered reflecting prolonged periods with little or no precipitation and corresponding reductions in streamflows. Initial actions include voluntary reductions in water use

with the most extreme level (Level III) potentially resulting in regulation of water restrictions by provincial agencies. The typical *Low Water Response Teams* that are formed include representatives from municipalities, provincial agencies, the agricultural community, sportsmen associations, golf courses, aggregate operators and the water bottling industry. The teams will meet to review low water conditions; communication action plans to landowners and water conservation recommendations.

Source Protection Initiatives

The contamination of the water supply in the Town of Walkerton in 2000 has led to the province looking at protecting drinking water supplies at its source. Conservation authorities have been identified as playing a key role in the development of source protection plans to protect municipal drinking water supplies. Technical

teams have been formed in watershed regions to gather data and information in characterizing the watersheds for the preparation of source water protection plans. The information gathered from existing studies and through new studies has helped all conservation authorities gain a better understanding of the dynamics of their watersheds and the impacts of water taking on surface and groundwater supplies. Shortly, *Source Water Protection Committees* will be formed for each watershed region to prepare assessment reports for their watersheds and ultimately source water protection plans to ensure the long-term protection of drinking water supplies.

Minimizing Sediment Loading

A continuing problem in protecting water resources has been attempting to control sediment loading to watercourses particularly from construction and de-

velopment activities. Section 36 (1) of the *Federal Fisheries Act* states that “no person shall deposit or permit the deposit of a deleterious substance into water frequented by fish.” The release of sediment to a watercourse is considered a deleterious substance by the Department of Fisheries and Oceans and there have been well documented cases of substantial fines levied for violation of the Act relating to the release of sediment particularly resulting from construction activities.

Excess sediment can have impacts on fish through abrasion of their gill membranes and suffocating of their eggs. Sediment can also carry toxins, bacteria and excess nutrients and can result in the depletion of oxygen within a water body. Physically, excess sediment can affect flooding, fill in wetlands and influence the geomorphic stability of a watercourse channel.

Fish are typically stressed where total suspended solids (TSS) exceed levels of 200 mg/L for prolonged periods. Studies on construction sites in Piedmont, Vermont show the benefits of having erosion and sediment control practices in place in relation to concentrations of sediment:

Pre-construction (background level):	25 mg/L
Post construction:	50 mg/L
Erosion & Sediment Controls:	283 mg/L
Erosion Controls Only:	680 mg/L
No Erosion or Sediment Controls:	4145 mg/L

Studies undertaken more recently in the Toronto area have shown similar results.

Typical factors contributing to problems on construction sites relate to lack of phasing during clearing and grading; long lags between soil disturbance and stabilization; unnecessary clearing of sensitive areas such as riparian buffers, steep slopes and wetlands; inadequate maintenance of sediment controls; poor field inspection practices and enforcement of erosion and sediment control plans.

Erosion and Sediment Control Plans are typically required by conservation authorities through approvals associated with their regulations or by municipalities as conditions of development through the planning process. Recently the conservation authorities within the Greater Toronto Area have produced an *Erosion and Sediment Control Guide for Urban Construction* (December 2006). The purpose of the guide is to improve the practice of sediment control, ensure that a well-defined process is in place and ensure that Erosion and Sediment Control plans are prepared, implemented and enforced. The guide stresses the importance of erosion prevention. It is intended for contractors, consultants, developers/owners, government agencies and government inspectors. Current erosion and sediment control practices and methods are illustrated. More information on the document and up-to-date information on sediment and erosion control is at www.sustainabletechnologies.ca.

Water Takings

A *Permit to Take Water* (PTTW) is required from the Ministry of the Environment where the taking of water from a surface or groundwater source exceeds 50,000 litres per day (10,000 gallons). In recent years, the Ministry of the Environment has initiated new water conservation requirements for permits to take water. A new classification system has been introduced that places takings in categories as to their potential for causing adverse environmental impacts. There is a greater emphasis on maintaining data on the taking of water on a daily basis and requirements for monitoring and reporting on an annual basis. Water takings in high use watersheds can be refused. Conservation authorities have always been concerned with the taking of water within their watersheds and the cumulative impacts that can affect the aquatic environment. While the Ministry of the Environment

through their PTTW controls the actual taking of water, conservation authorities can influence the water takings through their regulatory control on the structures that are required to facilitate the water taking.

In some watersheds, strategies have been developed that set thresholds below which water cannot be taken. In permitting the intake structures, the conservation authority can establish the setting of the intake to ensure that water is not taken during periods of low flow where the taking would affect the established threshold for that watercourse. In dealing with developments such as golf courses, new golf courses and changes in designs to older golf courses, designers have looked at retaining more runoff from overland flow into larger irrigation reservoirs. This ensures that there is less reliance on water taking, particularly during drought or periods of low precipitation. In many cases, these reservoirs are large enough to supply other ponds scattered throughout the course that are in place for aesthetics or “water hazards” rather than for irrigation purposes. With many of these new designs or re-designs, conservation authorities will work with the Ministry of the Environment and the applicant to ensure that any water taking from a watercourse will not result in environment impacts by constructing the intakes so that water can only be harvested during high flows.

In summary, the main role and mandate of a conservation authority is to provide for programs that protect and enhance the natural resources of its watershed and to provide for the protection of property and life through regulatory control pertaining to natural hazards. Hopefully, this article has helped explain some of the history of the conservation authority movement and some of the tools, programs and partnerships that are utilized by conservation authorities to fulfill their role and mandate. ♦

WATER EFFICIENCY IN HALTON REGION

WAYNE GALLIHER, WATER/WASTEWATER OUTREACH COORDINATOR, HALTON REGION

With the increased temperatures experienced during summer periods, water utilities across Ontario face an increase of peak in water servicing demands attributed to recreational tasks such as car washing and filling of swimming pools, seasonal irrigation of lawns and gardens, and increased personal water consumption. Should periods of peak consumption persist and recovery of water distribution system reservoirs be unachievable or overall system pumping capacities thresholds be threatened, many water service utilities are required to put in place watering bans and/or restrictions to ensure adequate levels of water are reserved for residential and business based consumption requirements and fire protection purposes.

Residential water consumption can as much as double in summer periods. It is in the best interest of water service utilities to limit the operational impacts of unnecessary treatment when looking to the added costs of additional treatment chemicals needs, energy used in treatment and

distribution, and the secondary treatment of added wastewater volumes experienced under increased water peak consumption periods. As such, the introduction of numerous municipal based water efficiency programs and policies have fast become the most cost effective and environmentally friendly means in achieving reductions, and creating additional capacity, to limit the operational impacts experienced during peak summer periods.

In working to reduce the impacts of peak seasonal water servicing demands and to demonstrate environmental stewardship of the region's water resources, Halton Region has employed a combination of demand side management, public education and bylaw based water conservation measures.

Water Balance Audits

As part of Halton's demand side management initiatives, an annual *Water Balance Audit* is completed to assess the overall efficiency of each of the region's water distribution systems through a comparison of water production, billed water

consumption and the calculation of water volumes attributed to non-metered tasks. In response to levels of lost water identified through the audit, Halton has employed an ongoing leak detection program to assess daily water flows into areas of suspected loss and to pinpoint water leakage in each water distribution system. Further to leak detection studies, demand side management initiatives have also transcended to include the region offering voluntary water use audits to large Industrial, Commercial and Institutional (ICI) water users within the Halton Hills groundwater based communities of Acton and Georgetown. Through this initiative, representatives of the Halton water conservation program assess how water is utilized at each site, and following a flow monitoring period at the site, provide a detailed report of possible measures which could be undertaken to limit the use of excess volumes of water observed.

Educating the Public

To promote public knowledge of water conservation practices and programs
