Problems caused by the misuse of turf chemicals and what to do about them

Fuel Oil Damage

Turfgrasses around fuel oil intakes on lawns are often subjected to this type of damage. When fuel oil is spilled on turf, it kills the plant. If enough is spilled to soak into the soil, it renders the soil useless for plant growth. The fuel oil cannot be leached out of the soil, and will remain in it for extremely long periods.

The only solution is to dig the soil out and replace it with new soil. Depth of the soil removed should be well below the layer that is saturated. If this is not done, grass plants in the new soil may germinate and grow but may die later on when the roots reach the fuel-oil-saturated soil below.

Loose stone, sand, or any porous material can be used around the intake pipe to catch drippings from the delivery hose. A circle 8 to 12 inches in diameter is sufficient.

If the problem occurs again, the best solution would be to change fuel oil dealers!

Weed Killer Damage

Although all good weed control chemicals carry detailed instructions regarding rates of application, etc., it still requires the ultimate user to use good judgment and common sense regarding how and when they are applied.

In this case (and one that occurs quite often) the material was carefully applied on the road shoulder between the road and the lawn. It was heavily infested with weeds. Unfortunately, a heavy downpour immediately following application of the chemical washed the materials down into the turf. As advertised the chemical did a good job of eradication on the weeds—and the lawn.
