1981 Manager's Guide to Buying

The Turfgrass Environment: Management Series Part III

Junipers: Varieties to Fit Any Landscape

"I wish my quarterbacks were as durable as this John Deere Tractor."

Coach Dan Spadoni, Dollarway High School, Pine Bluff, Ark.

Last season, Coach Spadoni had all four of his quarterbacks out at one time or another with injuries.

But his John Deere 850 Tractor never missed a day's work.

"In the two years we've had it, we've used it to mow both of our football fields, the practice field and the grounds around the school," says Coach Spadoni.

"And we've never had any problems. Even opposing teams have told us ours is the best field they've played on!"

Which, of course, is why Coach Spadoni and School Superintendent James Matthews decided to buy a John Deere 'Little-Big' Tractor in the first place.

Not too big, not too small

They were looking for a tractor big enough to handle

**Maximum PTO horsepower at 2600 engine rpm (by official test).*

***Maximum PTO horsepower at 2400 engine rpm (by official test for the 950, factory observed for the 1050).*

a large-acreage mowing job. Yet small enough so it would be economical to buy and operate.

The 22-PTO-hp* John Deere 850 filled the bill on both counts.

Its compact, water-cooled, 3-cylinder diesel engine has the power and stamina to run a rotary mower day after day, year after year. Yet being a diesel, it gives the kind of fuel economy a school's budget really appreciates.

More than just a mower

Another reason Coach Spadoni picked the John Deere 850 is its versatility.

It has a well-spaced 8-speed transmission that can match up to just about any job you want to do, plus a differential lock.

It has a Category I 3-point hitch, 540-rpm PTO and adjustable drawbar, plus more than 20 power-matched implement options.

And it's available in a variety of different tire styles and sizes.

Built to last

Of course, like all John Deere tractors, the 22-PTO-hp 850 is built to last.

"You can actually feel how solid it is when you ride it," says Dan Spadoni.

And to prove it, we ask only that you test drive one yourself at your nearby John Deere dealer.

Try out the 850, the 27-PTO-hp 950 or the new 33-PTO-hp 1050 with turbo-charged diesel engine:**

See for yourself why John Deere 'Little-Big' Tractors are a big winner with schools, parks and golf courses everywhere.

Nothing runs like a Deere®

For more information, write John Deere, Dept. 63, Moline, Illinois 61265.

Banvel®
herbicides
**your Big Plus
Solution
to year round
vegetation
management**

BANVEL adds a Big vegetation control PLUS to every vegetation management program.

More and more vegetation supervisors and applicators are switching to BANVEL® Industrial herbicides. They have learned that the broad spectrum vegetation control of BANVEL formulations makes an ideal addition or

substitution for the popular phenoxy herbicides in vegetation management programs.

Name any tough vegetation problem... broadleaf weeds... woody brush... or vines. We have a BANVEL herbicide program to keep problem vegetation in check.

There's a BANVEL Industrial formulation program for any need... roadside... railroads... utilities... drainage ditches... forestry projects... industrial sites... and many more.

Let us show you how you can cut application costs with our low oil or no oil application programs.

We have developed a BANVEL Industrial Vegetation Program for effective vegetation management all year long — spring... early summer... fall... or winter dormant applications.

Let our Velsicol Industrial Herbicide Specialists build a BANVEL Vegetation Control Program to meet your specific problems and needs. Contact us today.

**Industrial Vegetation Control Department
Velsicol Chemical Corporation

GREEN INDUSTRY NEWS

Sod Convention Brings Industry Together

Manufacturers of sod equipment, seed distributors, turfgrass researchers, and sod growers from throughout Canada and the U.S. exchanged ideas at the American Sod Producers Association summer convention and field days in Edmonton, Alberta.

Under three days of July sunny skies, close to 600 ASPA members, families, and representatives of the turfgrass industry together enjoyed serious discussion and Western Canadian style entertainment.

When most arrived on Sunday, Edmonton was in full swing of its celebration of Klondike Days which relive an era past when settlers first began flooding the area for the rush of gold. Townspeople dressed in colorful garb of those days strutted through the downtown streets blocked to traffic.

Business began on Monday with a panel discussion in the host Four Seasons Hotel on "survival during an economic recession." Ray Johnson of Shamrock Turf Nurseries moderated the panel of speakers chosen from various geographic regions. Although all the speakers agreed that nothing is certain with the economy and that if they knew the answers they'd be millionaires, they said housing projections range to 23 million in the 80's, a good indicator of what the sod business will be.

Equipment innovations introduced at the Sod Producers summer show enthralled the crowd. The barn (background) housed indoor exhibits and a few mosquitos.

Big Lake Sod Farm, Ltd. hosted the irrigation demonstrations Monday afternoon and on Tuesday Don Stumborg, convention chairman, hosted the field demonstrations and exhibits on his 2,900-acre Gem Sod Farms. Observers could not come close enough to the new equipment and innovations revealed.

Roseman Mower Corp., Nunes Mfg., and Brouwer Turf Equipment demonstrated their latest mowers; Nunes Turf Vac Corp., and Brouwer picked up the clippings with their sweepers; Delmarva Textile Co. and Conwed Corp. exhibited netting;

Spyder Mfg. Co., Princeton Mfg. Co., and Brouwer showed how their forklifts handle sod pallets, which became filled from the work of harvesters made by Brouwer, Nunes, and Princeton. Ryan/OMC Lincoln demonstrated its sod cutter and Ferguson Fabrication ran a test of its sod extruder.

The manufacturers, constantly improving their equipment for the sod industry, showed efficiency in all areas — fuel, labor, and time. Observers said that some of these improvements would revolutionize the industry.

NURSERY

Nurserymen's show faces heat and inflation

An optimistic attitude overcame the scorching temperatures and fears of inflation at the American Association of Nurserymen's 105th Annual Convention and Trade Show held in Kansas City, MO, July 12-16.

With Kansas City and other parts of the country facing temperatures of 105° to 110°, over 1,300 nursery men and women attended the convention activities. The activities included 77 exhibits represented by 63 firms; a tour to the Rosehill Garden Growing Field, which held a demonstration of nursery equipment for wholesale growers; a landscape/garden center tour covering successful garden centers in the city's suburbs; and a new program designed for juniors and teens to make this year's convention a family affair.

Fighting inflation and developing employee incentives were two of the primary themes explored in the general sessions.

Dr. Jerry Robertson of Ohio State University said that the market increase in the landscape industry, which was 12.6 percent per year since 1967, has only been 4.2 percent with inflation. Robertson said the production of nursery crops,

landscape products, and services to the trade must increase at least at the rate of inflation.

One of the greatest effects on productivity is labor, according to Sidney Meadows, Flowerwood Nursery, AL. He said: "Because of the escalation in wages, there is a need in an escalation of output or we'll price ourselves out of the market. The labor costs are 25 to 35 percent of the sales dollar out of nursery stock."

Another important factor affecting labor relations is the performance standards, said Bill Studebaker, Studebaker Nursery, OH. "Performance standards improve employee morale and increase output. They also allow you to set piecework rates, if necessary, for even the various or less glamorous tasks."

John Flemer, Princeton Nurseries, Princeton, NJ, has combined years of study and experience on the problem. He said "compensation, communication, and concern" are the three main aspects in the management of workers, which is also an effective means to head-off

Healthy Turf Next Spring Starts With IBDU® This Fall

Sure, there's more to maintaining quality, disease-free turfgrass than a couple of fertilizer applications. But turfgrass scientists across the country are reporting that a fall application of IBDU (31-0-0) can produce turfgrass with better root development and less disease problems.

Dormant turfgrass plants continue to produce rhizomes and roots, even though vertical growth has stopped. During this time nitrogen should be made available to the turfgrass plant as carbohydrates are naturally accumulating. Thus, scientists say, the optimum timing for nitrogen applications is during the fall and early winter months.

IBDU (31-0-0) is ideally suited for dormant nitrogen fertilization. Because of its slow release characteris-

tics based on hydrolysis, IBDU releases nitrogen later in the fall and earlier in the spring promoting better rhizome and root growth. A fall fertilizer program using IBDU should produce healthier more vigorous turfgrass plants and reduce the severity of several turfgrass diseases.

Remember. Healthy turf next spring starts with IBDU this fall.

“I could sure use a rugged mid-sized rotary that really maneuvers.”

A lot of our customers have been wanting a mid-sized mower that's built tough to take it, and that's highly maneuverable at the same time.

So our engineers came up with the amazing Turfcats.

It's amazing because it's absolutely packed with features that help you get your medium-sized mowing jobs done faster and better than ever.

First, you have a choice of a 50" or 60" deck. (They're interchangeable.) Fully articulated, they closely follow ground contours so you get a smooth, even cut with practically no scalping.

Deck design lets you trim close, and also gives super clipping dispersion. The deck raises and lowers hydraulically for curb climbing and transport. And you can adjust cutting height from 1" to 4".

Then, the three-wheel, wide track design gives the Turfcats great stability on slopes. And the foot-operated hydrostatic drive lets you steer and maneuver while changing speeds or going from forward to reverse.

How about hill climbing? It's a breeze with the power delivered by the husky 18-HP Kohler overhead valve engine. And you can expect a long engine life filled with good fuel economy.

Plus, the Turfcats are quiet. All controls are within easy reach. And it might very well be the most comfortable riding rotary in the world.

Ask your Jacobsen distributor for a Turfcats demonstration. And have him explain about the many fine features that customers want.

The more you listen to what he has to say, the more you'll know we've been listening.

We hear you.

GREENHOUSE RESEARCH EXPLORES HERBICIDE/TURF DISEASE RELATIONSHIP

By Clinton F. Hodges, Professor of Horticulture and of Plant Pathology, Iowa State University, Ames, IA

Postemergent herbicides are indispensable tools for the maintenance of high quality turf. Most temperate origin grasses show good tolerance to the auxin-like herbicides (2,4-D, 2,4,5-T, MCP, dicamba) but absorption of the herbicides by tolerant grasses has aroused interest in the potential influence the herbicides may have on the physiology of the tolerant grass. Studies with various crops have examined potential interactions between herbicides in tolerant and non-tolerant species and the severity of diseases. Since most postemergent herbicides are synthetic growth regulating hormones, much interest also has been directed at their immediate effect on the growth and reproduction of plant pathogenic fungi. The purpose of this presentation is to summarize research conducted in our laboratory on the influence of postemergent herbicides (2,4-D, 2,4,5-T, 2,4,5-TP, MCP, dicamba) on the biology of *Helminthosporium sorokinianum* (= *Drechslera sorokiniana*) and on the severity of leaf spot on Kentucky bluegrass.

Herbicide Effects on the Pathogen

Leaf spot development induced by *H. sorokinianum* involves the life processes of both the pathogen and the leaf of the grass plant. The effect of any substance on the development of the lesion must be viewed relative to both living entities. The influence of 2,4-D, 2,4,5-T, 2,4,5-TP, MCP, and dicamba show various stimulatory and inhibitory effects on the germination of *H. sorokinianum* conidia, growth of germ tubes, mycelium growth, and conidia production. Relatively high concentrations (10⁻³M) of these herbicides prevent the germination of conidia, but more dilute concentrations (10⁻⁴ to 10⁻¹²M) have no effect on germination. These observations suggest that the concentrations of 2,4-D, MCP, and dicamba currently used for weed control in turf will neither inhibit nor stimulate the germination of *H. sorokinianum* conidia.

The most dramatic effect of 2,4-D, 2,4,5-T, 2,4,5-TP, MCP, and dicamba on *H. sorokinianum* is stimulation of growth of conidia germ tubes after germination. The growth of germ tubes may increase 2X to 3X in response to various concentrations of each herbicide. Only 2,4,5-TP demonstrates some inhibition of germ-tube growth at higher concentrations. The significance of germ-tube stimulation relative to infection of leaves and disease development is unclear. It is well established that stimulation of the growth of a pathogen is not necessarily related to its ability to increase disease.

Most of the commonly used postemergent herbicides will stimulate mycelium growth of *H. sorokinianum* in culture. MCP and dicamba are stimulatory in very dilute amounts. 2,4-D shows stimulation at high concentrations. The importance of mycelium stimulation relative to disease development is unknown. Such stimulation could, however, be of some importance in aiding *H.*

sorokinianum colonize dead grass tissue.

The influence of postemergent herbicides on the ability of *H. sorokinianum* to produce spores is mixed. 2,4,5-T and MCP inhibit sporulation at most concentrations. 2,4-D, 2,4,5-TP, and dicamba show some stimulation of sporulation. These observations could be important to the ability of *H. sorokinianum* to produce spores on dead grass tissue; herbicide stimulated or inhibited spore production could subsequently influence the number of potential infections.

Herbicide Effects on Leaf Spot Development

Research conducted in our facilities over the last six years has established that the postemergent, synthetic auxin-like herbicides (2,4-D, 2,4,5-T, 2,4,5-TP, MCP, and dicamba) can function in a host-pathogen-herbicide interaction involving *H. sorokinianum* and Kentucky bluegrass, to increase or decrease leaf spot severity. Kentucky bluegrass exposed to 2,4,5-T, MCP and dicamba by means of leaf sprays or soil applications and then infected with *H. sorokinianum* show a 2X to 3X increase in leaf spot severity. Plants sprayed with 2,4-D and then infected generally show no change in disease development, but 2,4-D applied to the soil in-

The most dramatic effect on leaf spot development is stimulation of the growth of conidia germ tubes

creases disease severity markedly. 2,4,5-TP applied to Kentucky bluegrass as a spray or as a soil drench inhibits leaf spot development at higher concentrations and stimulates development at lower concentrations.

Recent studies in our laboratory have established that herbicide stimulation of *H. sorokinianum* leaf spot on Kentucky bluegrass is associated with the aging process of the leaves. Leaf spot normally becomes more severe on each older leaf of the shoot; when the shoot is exposed to 2,4,5-T, MCP, or dicamba and infected the increase in disease is least severe on the youngest leaves and most severe on the older leaves.

Mechanism of Herbicide Stimulated Leaf Spot

Existing plant science literature suggests that auxin-like herbicides may function to retard or to stimulate the aging process in leaves. Such observations may provide some insight into the host-pathogen-herbicide interactions resulting in more severe leaf spotting of Kentucky bluegrass. It seems that in a very general way, auxin-like herbicides introduced into young leaves, where cell division and expansion is occurring, may help maintain this youthful condition; however, introduction of the

same auxin-like herbicide into fully developed leaves where cell division and expansion have ceased, and where normal aging processes have started, may increase the rate at which the leaves age. It is known that leaf spot severity increases on each older leaf of the shoot; i.e., leaf spot is enhanced by the aging processes of each older leaf. Therefore, when the two oldest fully developed leaves of the shoot are exposed to auxin-like herbicides they may age at a faster rate and, if infected, the disease will increase in severity. This concept is less clear relative to disease development on the youngest, expanding leaves. The increase in leaf spot severity on the youngest, visible leaf of Kentucky bluegrass exposed to auxin-like herbicides is less than that on each older leaf; in fact, 2,4-D will not increase the disease on the youngest leaf. The youngest leaf often shows the same or slightly higher disease levels in response to the auxin-like herbicides. The two youngest leaves are in a very youthful condition and as such do not respond to infection with extensive yellowing and blighting. Hence, the youthfulness of these leaves retards extensive disease development; the promotion of disease on these leaves by the herbicides is minimal. The slight elevation in disease is not explainable relative to aging because in young, expanding leaves the auxin-like herbicides would probably be youth promoting. The greater increase in disease on the second oldest leaf still suggests a herbicide-aging interaction that increases disease.

Significance of the Herbicide-Leaf Spot Interaction in the Field

Observations on the stimulation of *H. sorokinianum* leaf spot on Kentucky bluegrass by postemergent, auxin-like herbicides have been made under the controlled conditions of greenhouse and growth chamber studies. To date, experimental evidence from field studies has not been obtained. The leaf spot symptoms produced

Severity of leaf spot increases on each older leaf of a Kentucky bluegrass shoot in response to 2,4-D, 2,4,5-T, MCPP, and dicamba. A. Youngest leaf shows small brown lesions with minimal yellowing of tissue around lesions. B. The second youngest leaf shows enlarged brown lesions and an increase in yellowing of tissue around lesions. C. Next to the oldest leaf on the shoot showing enlarged brown lesions and yellowing that surrounds and interconnects lesions. D. The oldest leaf of the shoot shows very large lesions and extensive yellowing of the entire leaf. Leaf spot severity normally increases on each older leaf, but the herbicides increase the level of disease beyond what normally occurs.

in response to herbicides in greenhouse studies, however, are not unlike those observed in the field during late spring, summer (with irrigation), and fall to early winter. It is probable, therefore, that herbicide stimulation of leaf spot may occur in the field. Such stimulation probably would be erratic in its occurrence; i.e., the herbicide, pathogen, and proper moisture and temperature must occur simultaneously to increase the severity of leaf spot. Early spring applications of herbicides probably would have little effect on leaf spot development because of the lush, youthful condition of the leaves; with normal senescence, however, in late spring and early summer the herbicides may be a factor in increasing leaf spot severity, especially with irrigation or during a wet season. Preliminary

All factors must occur simultaneously to increase severity

studies suggest that increasing temperature from 72° to 86° will increase the yellowing and blighting caused by leaf spot on plants exposed to herbicides. This suggests that on irrigated Kentucky bluegrass auxin-like herbicides could have a substantial effect on promoting leaf spot damage during periods of warm weather. Auxin-like herbicides might be most promotive of leaf spot in fall and early winter when shorter daylength, and the herbicides may contribute to the rate at which leaves age and subsequently predispose them to more severe leaf spot development.

TURF MANAGEMENT SERIES/PART 3

The Turfgrass Environment

Pair for the Course

Pennncross Penneagle

Pennncross greens are known around the world for their consistent, high quality putting surface. Pennncross has genetic diversity assuring disease resistance . . . germinates fast, establishes quicker . . . superbly consistent, less grain for true putts . . . greens up earlier, holds summer color better . . . great for overseeding winter greens in south.

Penneagle was developed through 18 years of research and 5 years of testing. This new variety of creeping bentgrass has these selected attributes of a great all-purpose grass for the entire course. Penneagle has a broad genetic base for greater climatic adaptability . . . is not overly aggressive, but competitive with *Poa annua* . . . has tight, more upright growth characteristics . . . is finer leaved than most bents . . . has excellent putting and playing qualities . . . was bred for disease resistance.

SITE CONSIDERATIONS

Progress in turfgrass science provides today's lawn installers with high quality turfgrass seed and sod. The biggest risk has therefore become the readiness of the site for the seed or sod.

The site must provide the physiological needs of the desired turfgrass. The purpose of this article is to describe these needs and how to alter a site to supply them.

No professional lawn installation should proceed without a thorough evaluation of the site and a soil test. The results should be discussed with the customer with a simplified explanation of the needs of the desired turfgrass. Geographically impractical turfgrass species should be eliminated and the customer's desired level of maintenance should be established. Share your knowledge of improved turfgrasses. There is a good selection of both seed and sod so the customer can have a custom lawn. Today, a quality lawn is a sales tool in real estate. The residential customer can have an individualized lawn in addition to a sales advantage.

The commercial customer installing a new lawn at its building site is a tougher challenge. If the landscape architect is not up on improved turfgrasses, it takes a strong salesman to get improved varieties in the specifications. Too many industrial sites, multi-family housing developments, and shopping areas are seeded or sodded with outdated or cheap turfgrass varieties. The low bid process encourages this unless the improved turfgrasses are specified during bidding.

The scope of commercial jobs also encourages the use of hydraulic seeding with higher seed rates. Hydraulic seeding has grown in popularity as the least labor intensive way to seed all types of lawns.

Soil samples should be taken for every site and tested for texture, nutrients, and pH.

General contractors often want the lawn installation handled quickly and simply. This, however, is not always the best for the site. The owner must clearly specify his desire for quality turf by the best methods available. To achieve a quality lawn, some hand seeding and sodding is usually required. The hydraulic seeder is a great tool, however, research on the use of hydraulic seeding for fine turf is limited.

The health of a turfgrass plant is entirely dependent upon its environment, both above and below the soil surface. Once the seed has germinated, that plant must adapt to its fixed position or die. Man has the knowledge and ability to amend both above and below surface environments so that the turfgrass plant has optimum growing conditions. The best time to make the changes is before planting or sodding. If the basic needs of the turfgrass are provided, the plant will exercise its own ability to adapt to the stress of heat, drought, or wear. Turfgrass selection and breeding have provided turfgrasses that exhibit greater ability to adapt to stress. That

does not reduce the need for site preparation in the case of fine turf.

Site preparation can be more than soil preparation. It could include thinning tree cover, installation of irrigation or drainage, filling low spots, changing slopes, installation of anticompaction or erosion control netting, or even installing a sidewalk to direct foot traffic off the lawn. Any change which improves the turfgrass environment is considered site preparation.

The environment must provide all essential requirements for the life processes of the turfgrass. These include light, water, numerous chemical elements, and air (gases). The environment should also include preventative conditions, such as air circulation, drainage, relatively neutral pH, minimal thatch, and few insects.

All chemical reactions are temperature dependent, require energy, and can be influenced by chemical balances, such as acidity, cation exchange capacity, and the presence of needed elements. Understanding basic chemical reactions of plant growth helps clarify the need for site preparation.

The most important process is photosynthesis. In photosynthesis, carbon dioxide from the air and water are converted to organic carbon compounds which are used in plant growth. Light energy, absorbed by the chlorophyll in the plant, powers this reaction. Lack of carbon dioxide is rarely a problem, but water and light can be lacking very easily. Excessive shade or drought are common problems in turf areas.

The carbohydrates produced by photosynthesis are either utilized to power other growth and maintenance reactions or stored.

One major use of carbohydrates is respiration, in which the car-

Groundwater

Nutrient Solution

O_2
 H_2O
 CO_2

bohydrates and oxygen react to release energy and to produce carbon dioxide and water. The plant uses the energy released to power other vital life processes. Respiration is increased by higher temperatures or nitrogen fertilization.

It is important that the plant maintain a reserve of carbohydrates for use when plant needs exceed carbohydrate production by photosynthesis. Excessive respiration, caused by overfertilization can deplete these reserves. Storage is greatest on sunny, cool days, especially just prior to onset of winter dormancy. Nitrogen fertilization at this time is discouraged.

One reason nitrogen encourages respiration is its part in protein synthesis. Nitrogen is a key element in amino acids, a major component of protein. Protein is the structural material of cell walls and the plant's genetic code. Abundant nitrogen stimulates growth and the respiration to support it.

Many other elements play a part in the various biological reactions of plant existence. (See table) They supply needed components for physiological processes. Specifically, potassium and phosphorus are critical for a good seedbed because they effect root health. The ability of rhizominous and stoloniferous turfgrasses to spread is also dependent upon adequate levels of potassium. Low potassium levels encourage carbohydrate reserve depletion. Potassium does leach, especially in sandy soils and needs to be replenished. Phosphorus is relatively stable in soil and is not prone to leaching. Consequently, phosphorus should be mixed with the topsoil.

Other important elements are calcium, sulfur, magnesium and a score of other minor elements. Calcium encourages root growth, effects the cation exchange capacity of the soil, and often improves general soil structure. Sulfur is an important part of protein synthesis, it also can be used to acidify alkaline soils. Magnesium is an important part of chlorophyll and effects the green color of turfgrass stands. It is also part of protein synthesis and influences the use of available phosphorus in the plant.

Minor elements include iron, zinc, copper, chlorine, boron, molybdenum, and manganese. Iron assists in the production of chlorophyll and will deepen the color of turf. Most minor elements can be unavailable to plants if soil is too acidic or alkaline. The role of some of the

Element	Chemical symbol	Importance in plant function
Nitrogen	N	The nitrate form is reduced to amino acids which are used to synthesize proteins, such as the structural protein of cell walls. Important in formation of nucleic acids which control genetic code of the plant. Also important in synthesis of coenzymes, vitamins, hormones, and pigments.
Potassium	K	Important in the glycolic pathway, one of four reaction sequences in the respiration process which converts glucose produced by photosynthesis into plant energy. Functions primarily as an enzyme activator.
Phosphorus	P	Also important in formation of nucleic acids. Is a constituent of phospholipids, which with proteins, constitute membranes which maintain structural integrity of plant cells. Important in organic compounds which provide energy for chemical reactions.
Sulfur	S	A constituent of certain amino acids and protein. Also found in coenzymes for lipid (fat) and carbohydrate metabolisms.
Calcium	Ca	Important in developing cell structure and permeability properties of membranes.
Iron	Fe	Essential for chlorophyll synthesis
Magnesium	Mg	An essential constituent of chlorophyll. Seems to function by binding together subunits which make up ribosomes which synthesize proteins.
Boron	B	Unknown. Suggested that borates prevent excess phenolic acid production. Phenolic acids accumulate in boron deficient plants.
Manganese	Mn	Formation of oxygen in photosynthesis. Specifically required for action of some enzymes.
Copper	Cu	Found in enzymes required for respiration and photosynthesis.
Zinc	Zn	Found in several enzymes essential to respiration and nitrogen metabolism.
Molybdenum	Mo	Found in enzyme for N ₂ fixation, and enzyme essential for reduction of nitrates (NO ₃) to ammonia.
Chlorine	Cl	Activates oxygen production system of photosynthesis.
Sodium	Na	Required by certain halophytic (salt-loving) plants.
Silicon	Si	Required by some grasses and sedges for cell wall formation.

minor elements is not clearly understood. Sandy and alkaline soils may require addition of minor elements.

The purpose is not to give a lesson in chemistry, but to show those things that a turfgrass plant requires from its environment. The next step is to identify site conditions which either permit or restrict the supply of these needs. Since soil is the medium for most of these needs, it is the best place to start.

Soil

The goal in site preparation is to provide a six to eight inch layer of soil that has desirable texture, structure, and chemical balance. The components of the soil determine these characteristics. Soil amendment may be needed to establish a suitable rootzone for the turfgrass.

Soil is layered. The primary concern is the few inches of topsoil, but lower layers effect drainage, upward movement of water, and chemical activity. Special care to all layers of soil is given during construction of golf greens and other athletic fields. On large areas where lower layers may pose problems but the scale makes changes impractical, special attention should be given to maintenance needs, such as topdressing, aerification, fertilization, and installation of drainage and irrigation systems. The purpose is to counter-balance the effects of an inferior soil.

The typical soil of an area is derived from the parent material which may have been the bottom of a lake, a glacier, a volcano, or other mineral or organic material. Other factors influencing soil content are the climate of the area, the period of time during which the soil developed, the vegetation that had grown there previously, and the topography of the area. All these factors combined resulted in the soil characteristics of any area.

Soils are classified by type or combination of types, including sand, silt, and clay. (See diagram). These identify textural characteristics of the soil. Soils are also classified by structure based upon the shapes of individual groups of particles, or aggregates, in the soil. The size of the aggregates is also a factor in seedbed preparation. Pea-sized aggregates are preferred.

The texture and structure of a soil has a great effect on drainage, movement of chemicals in the soil, upward movement of water (capillary action), rooting ability, and presence

Layers or horizons of soil The A horizon should be six to eight inches deep and of appropriate texture, pH, nutrient content, and drainage.

Depth of topsoil affects retention of water following irrigation or drainage.

of needed gases in the soil. Loam soil is actually a combination of sand, silt and clay.

Another way to classify soils is as mineral or organic. The organic matter content of mineral soils is less than ten percent, whereas organic soils contain more than 20 percent organic matter. Organic soils are preferred where possible. Michigan sod growers switched from mineral soils to organic soils as part of their growth in the 60's. If the organic matter is only slightly decomposed the soil is termed peat. If the organic matter is well decomposed the soil is termed muck.

Soils with large amounts of undecomposed organic matter need the assistance of bacteria, protozoa, nematodes, algae and fungi for breakdown. Poorly drained soils discourage these organisms from doing

their job. These organisms also are essential for thatch decomposition and breakdown. Decomposition is also related to the pH of the thatch and soil. Alkaline or acidic soils can prevent the breakdown of thatch and cause problems associated with thatch buildup.

The composition of the soil effects water accumulation and drainage. Sand soils do a poor job of holding water. However, they have the advantage of aiding drainage when added to other soils. Clay soils hold water but this water may not be available to the plant roots. Silt soils retain water well but also tend to compact easily. The pore space between soil particles determines the ability of the soil to hold and pass water. The organic matter content of the soil also aids in water retention. The ability of the soil to let water in

is called infiltration. If soils are compacted, pore space is limited and water will not flow into the soil easily. Water can be treated with wetting agents to reduce its surface tension and allow for easier entry.

The ability of the soil to allow water to pass through is called percolation. If soil layers are significantly different in texture, water movement downward can be hindered. If surface water is applied faster than the soil can take it in or let it flow through, puddling or runoff will occur.

The ability of the soil to hold water is closely related to its ability to hold needed gases. Many of the things that prevent water retention hinder soil aeration, such as compaction and lack of organic matter.

Water and air compete for the same space at times. Poor drainage inhibits soil aeration if water occupies all pore space. Turfgrass roots need oxygen to carry out respiration. Without the oxygen, the ability of the plant to power essential processes is severely restricted.

One final area of consideration for soils is the chemical balance. This is a more complicated subject concerning pH, cation exchange, and salinity. An imbalance of any of these can hinder the plant's health.

pH is a measure of the hydrogen ions in a solution. The more acid the soil is, the lower the pH will be. The

Texture is measured by the percentages of the three basic mineral components, clay, silt, and sand.

Porosity of soil determines compaction resistance as well as drainage and water and air retention.

THE GREENER KENTUCKY BLUEGRASS

more alkaline, the higher the pH. The number 7 is considered neutral and is also the optimum pH for growing turfgrass. Many things can cause soil pH to change; irrigation water of a different pH and materials containing sulfur such as ammonium sulfate. Soils containing large amounts of clay and organic matter tend to be acid. Periodic applications of limestone may be necessary for these soils. Excessive acidity reduces the amount of available phosphorus in the soil, reduces the activity of beneficial soil organisms, and increases the ionic concentration of potentially toxic minerals such as aluminum and manganese. Secondary effects include poor rooting, increased thatch accumulation, and reduced turfgrass vigor. Due to the effect on rooting, pH should be checked prior to seeding or sodding and corrected. Acid rain is a possible source of acidity.

Alkaline soils are usually associated with areas that have saline ground water, low rainfall, or are waterlogged. Overuse of lime can cause alkaline soil conditions. Alkaline soils restrict the utilization of iron, manganese, copper, zinc, and boron by turfgrass. Sulfur or fertilizers containing sulfur can be used to neutralize alkaline soils.

Saline soils are associated with areas of low rainfall where soluble salts have not been sufficiently leached out over time. They tend to be present in the ground water making irrigation with it little help. Irrigation with collected rainwater or use of salt tolerant turfgrasses are the only practical remedies. In the same general category are sodic soils which contain high levels of soluble sodium. Sodium has a detrimental effect on soil structure causing the breakdown of aggregates and clay particles. Application of gypsum can improve sodic soils.

The most complicated phenomenon of soils is the cation exchange capacity. Basically, chemical reactions involve the attraction of positively charged molecules (cations) to negatively charged molecules (anions). Plants require positively charged molecules of elements to carry out basic processes, such as calcium and potassium. The plant depends on the soil to hold these cations until it can use them. The ability of the soil to exchange a cation of its own for one of benefit to the plant is termed cation exchange capacity. The type of soil, texture, and organic matter content effect cation exchange capacity. Addition of

Acidity and alkalinity of regions in the U.S. (top) is closely related to average rainfall (bottom). Nutrient availability changes with soil pH.

organic matter increases the cation exchange capacity of the soil. The higher the cation exchange the better the soil holds onto valuable nutrients. Leaching is reduced in these soils.

There is no one preferred CEC. It varies according to the type of clay, organic content, and other components. If correction was advised, addition of organic matter would be the likely solution.

To provide the best environment for seed or for sod rooting the soil should contain appropriate nutrients, be neutral or slightly acid (6.5 pH), have an acceptable CEC, contain aggregates by cultivation and moderating or eliminating sodic conditions, and organic content of at least 20 percent. Best results with sod

rooting are obtained by purchasing sod grown on approximately the same type of soil as the site. Most sod is grown on muck soil. Decomposed organic material is preferred for amendment since decomposition of the organic matter consumes nitrogen that could be utilized by the turfgrass. Material should be composted before use.

To improve heavy clay soils, coarse sand can be mixed with the clay and organic matter to lower the clay content to 75 percent if possible. Calcined clay will also contribute to better water characteristics of soils. Sand and calcined clay can improve silty soils as well.

Sandy soils require the addition of clay and organic matter. Clay content of at least five percent is

Glade

Glade

U.S. Plant Patent 3151

KENTUCKY BLUEGRASS

Double-duty turf beauty. *The natural choice.*

The elite bluegrass growing in the sun is Glade. The elite bluegrass growing in the shade is Glade. That makes it the natural choice for all lawns. It performs well in up to 60% shade with a higher resistance to powdery mildew. Additionally, Glade has better-than-average resistance to Fusarium blight. It's now used as a prime ingredient for fortification in many professional turf grass mixes. A Rutgers selection, Glade has outstanding medium to deep green color. Low-growing Glade germinates and establishes fast, developing a thick rhizome and root system for close-knit sod.

Most lawn areas have both sun and shade naturally. That's why Glade Kentucky bluegrass is the natural choice. Specify Glade for your next turf grass mix. It's available at your local wholesale seed distributor.

Another fine, quality-controlled product of Jacklin Seed Company.

**When Dave Portz renovated 14 fairways with Roundup[®],
the members played the same day he sprayed.**

Dave Portz
Grounds Superintendent
Brookside Country Club
Mechanic, Pa.

Cleaning up a weedy fairway doesn't have to be a slow, messy job for you—or a hardship for your golfers.

Roundup[®] herbicide helps make renovation fast and efficient—as Grounds Superintendent Dave Portz discovered last year.

“If we had chosen to plow the course under, we would've had to close it,” Dave says. Instead, he applied Roundup on 14 weedy fairways, and reopened the course the same day. While Roundup worked, the members played over the dying turf, with no problems.

The members—and Dave—liked that. They were glad, too, that Roundup won't wash, leach or volatilize to injure desirable plants along the fairway. Dave simply took precautions against spray drift.

This year, reach for Roundup to control many tough weeds. It can make turf renovation fast and efficient for you—and leave a lot more playing time for your golfers.

For literature, call 1-800-621-5800, or in Illinois, 1-800-972-5858.

Disease susceptibility and thatch buildup can be reduced by adjusting pH.

desired. Fine sand content should be reduced as much as possible.

The perfect soil has never really been determined. The United States Golf Association recommends that pore space should be in the range of 40 to 55 percent. Since the size of sand, clay aggregates, and organic material varies, arriving at one combination is impossible. California research has indicated a mixture of 85 percent sand (.25 mm and bigger), 7.5 percent clay, and 7.5 percent peat is successful. That is an impractical amount of sand in the case of soil modification.

Just Published!

TURFGRASS MANAGEMENT by A.J. Turgeon

Brand new approach and terminology to provide a concise, consistent picture of the current state of turfgrass science and technology.

\$16.95

TURF MANAGER'S HANDBOOK by Dr. William Daniel & Dr. Ray Freeborg

This specially designed manual by leading turf specialists is a comprehensive, organized approach to turfgrass science and care. An easy-on-the-job reference for planning, purchasing, hiring, construction and plant selection.

\$18.95 hardback

TURFGRASS SCIENCE AND CULTURE by James A. Beard

Perhaps the biggest selling textbook to turfgrass students in the U.S. A comprehensive basic text and reference source on turfgrass culture.

\$22.95

DISEASES OF TURFGRASSES by Houston Couch

Reference for identification and control of fungus and nematode-incited diseases. This 2nd edition features new varieties of potentially hazardous turfgrass diseases, also pesticide regulation changes and more efficient fungicides on the market.

\$27.00

TURF IRRIGATION MANUAL by James Watkins

A guidebook for engineers, architects, designers and contractors. Keeps pace with the latest developments in turf and landscape irrigation. Specific chapters devoted to rotary sprinkler design systems, golf course design systems and expanded engineering and reference material.

\$19.50

TREE MAINTENANCE Pascal Pirone

The fourth edition of this guide for anyone involved in the care and treatment of trees. Special sections on tree abnormalities, diagnosing tree troubles, non-parasitic injuries and assessing the suitability of different trees throughout the country.

\$27.50

DISEASES & PESTS OF ORNAMENTAL PLANTS by Pascal Pirone

This standard reference discusses diagnosis and treatment of diseases and organisms affecting nearly 500 varieties of ornamental plants grown outdoors, under glass or in the home. Easy to understand explanations of when and how to use the most effective fungicides, insecticides and other control methods.

\$22.95

DISEASES OF SHADE TREES by Terry Tattar

Because shade trees require specialized maintenance rarely used in the forest, this text seeks to aid the arborist in providing necessary care to maintain vigor and prevent shade tree diseases. An in-depth look at infectious and non-infectious tree diseases. Plant pathology not necessary.

\$23.50

TREE SURGERY by P.H. Bridgeman

This practical guide to equipment required and operation methods attempts to give an up-to-date picture of the modern industry. Includes illustrative photographs and detailed line drawings.

\$17.00

THE PRUNING MANUAL by Everett P. Christopher

Latest information on pruning fruit and shade trees, ornamental shrubs and roses. 100 diagrams and photographs. Sections also devoted to forestry, grafting, root pruning, wound treatment and tools.

\$10.00

TREE CARE by John M. Haller

Urban trees are subjected to every kind of environmental stress and abuse requiring continuous attention to keep them healthy. This book gives you the how-to's of planting, feeding, pruning, repairing and defending trees against their enemies with special coverage of environmental damage and miscellaneous troubles.

Brouwer Sod Harvesters—Cut, Roll, Slab, Fold, all grasses, all seasons, all conditions in 15, 16, 18 and 24 inch widths and choice of pallet sizes.

Brouwer 7 gang P.T.O. mowers—cuts up to 7 acres per hour at normal speed with 30 HP Tractor. Unique Positive P.T.O. Drive uses less horsepower, successfully operates in varying grass conditions.

Brouwer 5 gang hydraulic lift P.T.O. mowers offer all standard Brouwer mower features plus hydraulic lift.

With an all Brouwer package, you can improve your bottom line.

Brouwer Harvesters give you a more uniform cut, less down time, less top soil removal and a harvester that operates off the uncut turf. Over 1000 Top Turf men around the world use Brouwer Harvesters to assure themselves top profit.

Brouwer Mowers give a smoother cut at lower cost. The lightweight high-stress steel frame combined with the simple, "no-wheel and gear" P.T.O. drive minimize flattening and avoid wheel tracks. The new Brouwer hydraulic lift mowers add another time saving innovation at a very low cost.

The Brouwer Package is easy to buy, easy to maintain, and fuel efficient. That means money in your pocket—a better return on your investment.

What do turfgrass experts say about Pennant* ryegrass?

The Turf Trial results speak for themselves. Pennant is a champion. Rigidly controlled, comparative testing involving Pennant and competing varieties of perennial ryegrasses were conducted by turf experts across a broad region of the U.S.—the Pacific Northwest, the Southwest, the Northeast.

Pennant topped many of its competitors in these tests, including overseeding and heat tolerance trials in the Southwest. Some of the expert's findings are illustrated below.

Turf performance scores. North Brunswick, N.J. 1975-78. (9 = Best).

YORKTOWN II	6.4
PENNANT	6.3
CITATION	5.9
DERBY	5.4
PENNFINE	5.4
MANHATTAN	5.2

Reaction to brown patch disease (Rhizoctonia), Adelphia, N.J., 1978. (9 = least damage)

PENNANT	7.5
YORKTOWN II	7.0
CITATION	7.0
REGAL	6.3
DERBY	6.2
PENNFINE	5.8

Warm and cool season average turf score, Southern California first-year tests, 1979.

	Poor	Best
PENNANT	[Bar chart showing Pennant as the best variety]	
PENNFINE	[Bar chart showing Pennfine as the second best variety]	
DIPLOMAT	[Bar chart showing Diplomat as the third best variety]	
YORKTOWN II	[Bar chart showing Yorktown II as the fourth best variety]	
MANHATTAN	[Bar chart showing Manhattan as the fifth best variety]	
CITATION	[Bar chart showing Citation as the sixth best variety]	

Pennant was best among 12 varieties tested for red thread disease (Corticium fuciforme) in 1-year average, 1979-80. Western WA. (Low score = Best).

PENNANT	20.7 %
CITATION	23.6 %
DERBY	26.3 %
PENNFINE	30.4 %
MANHATTAN	40.4 %
YORKTOWN II	47.8 %

Percent winter injury. Adelphia, N.J. March 1978. (10 of 26 varieties tested showed no significant injury.)

PENNANT	0%
MANHATTAN	0%
CITATION	11%
DERBY	14%
PENNFINE	18%
LINN	38%

Average Turf Performance scores, February 1980. Southern Arizona turf overseeding on Tifgreen Bermuda. Sixteen entries seeded October 1979. (10 = Best).

PENNANT	7.7
PREMIER	7.3
REGAL	6.3
CBS	5.7
DERBY	5.5
ANNUAL	2.3

Pennant was also found to maintain its excellent turf color and quality late into the season. Pennant will impress you with its rich, moderately dark green hue, its fine leaf blades, and its improved mowing properties. We call it "The Trophy Turf". We think you will, too.

For additional information regarding Pennant's truly remarkable Turf Trial performance, contact: Agriculture Service Corporation, P.O. Box 101, Harrisburg, OR 97446, Telephone: (503) 995-6124

*Plant variety protection pending and anticipated

How to choose the right iron.

Choosing the right golf club is a serious matter. You need one that's just right for the shot you have to make. You should take into account the distance, wind, lie, and obstacles.

At Kubota, we feel that you should devote the same careful attention to choosing a tractor.

YOU WOULDN'T TEE OFF WITH A BASEBALL BAT.

And you wouldn't want to get the wrong tractor for the jobs you have to do.

Whether you take care of a golf course, an estate, a campus, a park, or do roadside maintenance, you want a tractor that's versatile. Can it handle a mid-mount mower? A gang mower? Can it move dirt? Dig a hole? Kubotas can do all these things. Every Kubota has rear PTO and a 3-point hitch that can accommodate a wide variety of implements. You don't want a tractor so specialized it can do only one job.

Another thing you don't want is a tractor that's too big or too small.

KUBOTA. THE MID-SIZE TRACTOR.

Our tractors range from 12 to 81 horsepower. Small enough for economy, large enough for heavy-duty jobs. It's wasteful to use 100 horses for some mowing. And it's impossible for 10 horses to do heavy moving or hauling.

DIESELS. A KUBOTA SPECIALTY.

At Kubota, we've been making diesel engines for 30 years. In fact, all our engines are diesels.

Rear-mount mowers or rotary cutters are available for all Kubota tractors.

Diesel engines are rugged and durable. They have no electric ignition system, so they never need a tune-up. And running a Kubota diesel engine costs a lot less than running a comparable gasoline engine.

With many models to choose from, we have a tractor that's just right for the maintenance job you have to do. So see your Kubota dealer today. He'll help you get hold of the right iron.

WAIT! I want more information on all your mid-size Kubotas. Please send me a free copy of your latest brochure.

THE EEGER

BEEVER

A WHOLE TREE CHIPPER AT A BRUSH CHIPPER PRICE

Chip trees and limbs up to 12" in diameter—Chip sawmill slabs—Chip Christmas trees—Chip dry material—No need to cut to length with the heavy duty Eeger Beaver. A safe machine with no wood kickback—Operator can feed from curbside—Makes a dimensional chip—Operates with low fuel consumption and is no more expensive than a brush chipper.

Write **158** on reader service card

THE EEEGER BEEVER WILL OBSOLETE THE CONVENTIONAL BRUSH CHIPPER BECAUSE:

- It's more productive.
- It will last longer.
- It's less expensive to operate.
- It's less expensive to maintain.
- It's a safer machine to operate.

As seen in
American Public Works
Kansas City
Sept. 13-18.

Positive Control feed rolls with instant reverse drive.

Chip hardwoods, softwoods, whole trees, brush and Christmas trees.

HIRE THE INSECTICIDE THAT LIKES TO WORK OVERTIME.

DURSBAN* brand insecticides provide unsurpassed residual control of cutworms, chinch bugs, sod webworms, and a dozen other turf pests. Both DURSBAN 2E Insecticide and double-strength DURSBAN 4E Insecticide keep working a lot longer than other turf insecticides. This residual action saves you time, trips, and labor. It also saves you money. In fact,

DURSBAN insecticides cost less than most other turf insecticides.

Ask your supplier for the turf insecticide that works overtime for you. Get

DURSBAN 2E Insecticide or double-strength DURSBAN 4E Insecticide. Just be sure to read and follow all label directions and precautions. Agricultural Products Department, Midland, Michigan 48640.

DOW CHEMICAL U.S.A.

Finally, An Aid For Teaching Turfgrass

Superintendents, Contractors, Lawn Care Managers, New, On-the-Job Reference. The Turf Managers' Handbook is a comprehensive, organized approach to turfgrass science and care. It has been designed and written by leading turf specialists from Purdue, Dr. William Daniel and Dr. Ray Freeborg, for on-the-job reference and as a text for students.

The book contains 150 illustrations and 96 color photographs. Data includes 240 tables and forms. Included are specifications for rootzones, employment, calculations for

chemical applications, and extensive metric-imperial conversion. Business and technical aspects of turfgrass management are covered in this 424-page book. Planning, purchasing, hiring, construction, and plant selection are put together for easy on-the-job reference. Markets covered include lawn care, sod production, golf course management, cemeteries, athletic fields, and low maintenance areas. If it concerns turf, it's in the Turf Managers' Handbook.

The Swenson Pickup Package.

Heavy duty ice and snow control for light and medium duty vehicles.

When street and highway maintenance departments want top quality ice and snow control equipment, they come to Swenson. Now, you can too. The Swenson Pickup Package has been trimmed down in size. But we didn't cut corners on quality.

In front, there's an Easy-Hitch snow plow. Rugged and maneuverable, it mounts or dismounts in minutes. The driver has complete in-cab control. And it's custom engineered to fit the newest '80 and '81 trucks.

In back, there's a PV-300 V-box material spreader. It mounts and stores as a single unit. Capacity is over 1½ yards. And it's powered by either an auxiliary gas motor or the truck's hydraulics.

Whether you need a plow, a spreader, or the complete package, now you can insist on Swenson quality. Call today for the name of your nearest dealer.

Swenson—the tough choice.

Introducing the Front Line.[™]

The first mower built tough enough to be a Cushman.

There's a good reason why Cushman has been around for such a long time: We build equipment that lasts a long time.

And that's never been more obvious than with our new Front Line rotary mower.

Built for keeps.

The Front Line's 72" mower deck is made of 12-gauge carbon steel, reinforced and arc welded. It has a multi-disc PTO clutch, direct drive to the deck gear box with a sealed and lubricated shaft drive. The hydrostatic transmission is driven by two continuously engaged "A" section belts with self-adjusting tension.

There's no need to worry about overloading the Front Line's engine. The combination of our high torque engine and specially designed mower deck allows you to mow tall weeds and fine grass.

Superior performance.

The Front Line's cut in fine grass is so smooth, you won't believe it was made with three separate blades. That's because the blades overlap 1 1/2" to reach every inch of grass in the full 72" swath. Also, the cutting height is adjustable to eight positions, from 1" to 4 1/2" in half-inch increments.

Operating the Front Line couldn't be easier. With individual front wheel brakes, and wheel-type steering controlling a single rear wheel, you get tight maneuverability and better control on varying terrain.

The Front Line's mower deck makes your job easier, too.

It extends more than a foot to

one side, so you can trim right up to fences or trees. And it lifts hydraulically for transport over curbs. What's more, a large capacity fuel tank lets you work up to 6 hours between refills.

100% Cushman.

Most rotary mowers use engines built by outside suppliers. Not the Front Line. Its 18-hp, air-cooled engine is all-Cushman. So is the differential. And the PTO drive. Which means all parts and service are provided by your Cushman dealer.

Send us this coupon today, and we'll tell you more about the new Front Line: The only mower built Cushman-tough. 80-CUT-5

YES, I want more information on the new Front Line[™] rotary mower. Prove to me that it really is tough enough to be a Cushman.

Stanley Hydraulic Tools introduces its PR29/30 heavyduty tree pruners with a lightweight head that reduces operator fatigue. The pruners weigh

only 9 pounds; are 7 feet, 2 inches long; and have a 2¼-inch cutting capacity. The PR29/30 comes with fiberglass or aluminum handles, both thermally insulated

The Sensation Corp.'s latest mower is the 11L2-0 that is powered by a 2-cycle Kawasaki engine. Features of the 4.3-hp engine are a cast iron cylinder sleeve; few moving parts

for less maintenance; positive engine lubrication for mowing slopes; a 5-quart capacity fuel tank; and a case hardened steel crankshaft. A non clog suction lift blade cuts a 21-inch swath from 1 to 3 inches in height in ¼-inch increments.

J I Case features its DH4 hydrostatic drive trencher that permits forward/reverse and variable dig-

ing chain speeds with reduced engine problems. The DH4 trenches

Compact riding trenchers... PLUS!

Your Ditch Witch 2200 or 2300 machines can become much more than just riding trenchers. Add the versatility of a utility backhoe, a hydraulic breaker and/or the hydraulic boring unit package...and you have added a lot more production potential.

The A220 Backhoe was specially designed for the 2200 and 2300 models. This 5-foot-range unit can help meet those unexpected underground construction challenges. It has an 8-foot, 6-inch reach and does not interfere with backfilling.

The Roto Witch III hydraulic boring unit, a hydraulic breaker or any of several hydraulic tools can be used on the same machine as the construction needs dictate.*

Yes, if you have 2200's or 2300's in your fleet, you've got more work potential than really meets the eye. Contact your nearest Ditch Witch dealer or send for more information.

*Quick-couple hydraulic manifolds are available as an option on 2200 and 2300 models.

Write 143 on reader service card

I could use more work potential.

Please send me more information on:
(check one or more)

Equipment

continued

up to 406 mm (16 inches) wide and 1,829 mm (72 inches) deep. Two hydrostatic systems power the ground drive and the attachments.

Tuflex Mfg. Co. has introduced a fiberglass spray tank. The PC 200-gallon divided tank contains two

separate 100-gallon compartments for diversified spraying. Throwing two valve switches, the suction and return line goes from one chemical spraying to the other.

Bowie Industries is combining its Hydro-Mulcher with Ag-Chem Equipment Co.'s Ag-gator 2004 all-terrain chassis for easy grass and

plant growth in undeveloped areas and difficult terrains. The hydro-mulcher plants, seeds, sprigs, fertilizes, waters, sprays, and mulches in a one-step application that covers 200 feet.

Jacobsen Div. of Textron Inc., is offering the Turfcut, a riding rotary mower with an optional 54-inch dozer blade, front and rear traction weights, and tire chains. Besides dozing snow, debris, or materials, the machine mows with a 50- or 60-inch cutter deck.

**THE
QUALITY
NITROGEN**

NITROFORM

TM

NITROFORM[®] IS THE LONGEST FEEDING HIGH ANALYSIS ORGANIC NITROGEN.

Longest feeding is important when it's your job to keep the turf looking good all year. Especially now with the high costs for turf care.

Longest feeding means you can worry less. Repeat applications are narrowed down. You save energy, labor bills and headaches. While your turf stays healthy and green. Also good for trees and shrubs. Nitroform from Boots Hercules is the

standard of quality by which all other nitrogens are measured. It feeds naturally as your plants need it, balancing the feeding between roots and top growth.

Non-burning. Non-leaching. Odorless. Ideal for seed beds. Blue Chip[®] for dry application. Powder Blue[™] for liquid application.

If your fertilizer isn't lasting long enough, it doesn't contain Nitroform.

NEW! VERMEER V-454 TRENCHER DESIGNED FOR THE 80's

First thing you notice about the new Vermeer V-454 Trencher is the sound. It's different. It's a quiet machine, because it's built solid. No frills.

Just hard-working iron.

Heavy-duty, electrically-welded, steel frame. Heaviest

in its class! (But you expect that from

Vermeer.) A 4-speed mechanical drive keeps it simple and keeps you operating. Four-wheel drive gives you the traction and versatility to "walk" onto virtually any job site.

Power? A 140 CID Ford gas engine (diesel optional). Rugged, but fuel-efficient. And, with a 20.5 gallon fuel tank you've got the power and capac-

ity to dig all day without taking a break.

You'll also like the interchangeable digging attachments. No need to modify the power unit. Just switch and go. Up to 18 in. wide, 60" deep with the trencher. Or, up to 24 in. of cover depth with the plow. And with the front-end attachments to complete the job with one machine.

But the best news is the price!

Right now you can own a Vermeer at a price that's competitive with almost every other machine in its class. That's right! The superior quality of a Vermeer . . . at a price you can afford.

Want more information? Fill out the instant-action coupon. The Diggin' Dutchman will send you the information you want within 48 hours. For immediate help, see your

nearest Vermeer dealer. Or, call Toll-Free (800) 247-2347. In Iowa call collect at (515) 628-9333.

WEEDS TREES & TURF

9800 Detroit Ave., Cleveland, OH 44102

- Combat Nutrient Stress
- Treat for Insect Pests

Safe, Easy, Systemic!

EASY-TO-APPLY ENCAPSULATED IMPLANTS THAT WORK SYSTEMICALLY INSIDE THE TREE!

MEDICAPS are the treatment of choice for chlorosis and other nutrient stress. Available in iron, zinc and manganese formulations plus new multi-nutrient MEDICAP MD.

ACECAPS contain orthene* a "new generation" insecticide for environmentally acceptable control of many destructive tree pests.

Case DH-series... Alone at the top.

There's just one name on top of the underground now...J I Case! With the tough Case DH-series trenchers DH4, DH5, DH5 Quad and DH7.

Total hydrostatics are the heart of every DH trencher. A new hydrostatic trencher drive permits infinitely variable digging chain speeds... plus reverse. With a DH trencher, the engine operates at optimum RPM... so you don't have to lug it down to match chain speed or soil conditions. That means more efficiency. And greater fuel economy.

Diesel power comes standard with each DH trencher. The rugged liquid-cooled diesels are coupled to twin closed-loop hydrostatic systems to assure a constant source of power. One for ground drive, one for attachments. You've always got plenty of "live" action.

New steering wheel option!

Now Case offers you the choice of either the exclusive Case Mono-Stick or steering wheel* on DH-series trenchers.

*Available on DH units with rear-mounted trencher or line layer.

Built-in versatility gives every DH trencher more job capability. The trencher, backhoe and blade can be mounted on either end. So you can build your DH trencher just the way you need it. Articulation and hydrostatic ground drive give DH trenchers stability and traction. And the Case Mono-Stick makes operation easy... just push the direction you want to go.

The new Case DH4, DH5, DH5 Quad and DH7. See them soon at a Case Trencher Dealer near you. And put yourself on top of the underground!

J I Case

Lescosan 4-E

**EMULSIFIABLE LIQUID
A SELECTIVE HERBICIDE FOR USE IN
TURF, ORNAMENTALS AND GROUND COVERS**

ACTIVE INGREDIENT:
S-10, (diisopropyl phosphorodithioate) of
N-(2-mercaptoethyl) benzenesulfonamide 46%
INERT INGREDIENTS: 54%

Contains 4 Pounds Active Ingredient Per Gallon
U.S. Patent Nos. 3,205,253; 3,298,819
PROTECT FROM TEMPERATURES BELOW 42°F
Product crystallizes at lower temperatures

Timing of Application—General
(Continued from left panel)

For control of CRABGRASS, apply recommended rate (see "Rates of Application" section) in late fall—September or October—winter and summer control. With a late application, the application must precede emergence (see "Directions for Use" section).

For control of Annual Bluegrass, apply LESCOSAN 4-E at the recommended rate (see "Directions for Use" section) before the weed emerges.

In southern or western states, apply LESCOSAN 4-E at the recommended rate in late summer and early fall, after the initial application.

Consult weed specialists for additional information, or contact your local Lesco representative with local conditions.

LESCOSAN 4-E

APPLICATION
LESCOSAN 4-E must precede emergence of weeds which will emerge from the soil from the site above lawn sod. If weeds are present, apply LESCOSAN 4-E as late as possible before application. Any weeds present around the application site should be worked into the soil before application.

LESCOSAN 4-E should be applied only to the following:

Pod Trivialis
Saint Augustine
Red Top
Zoysia

LESCOSAN 4-E can be applied to any time thereafter.

LESCOSAN 4-E will be established

Lawn

Lakeshore is proud of its personalized service. You get that service over the counter and on the phone with people like Jimmy Cochran and Joe Winland. In the accounting department you get that service from Ron Gore and from Dan Dunstan.

Lakeshore Sells Lescosan (Betasan*) and Lescosan has been selling itself to you for years. On lawns and on golf courses, Lescosan has proven itself a highly effective, efficient and economical pre-emergence control for crabgrass and Poa annua.

If you know Lescosan, you know about Lakeshore Equipment & Supply Co. We sell Lescosan and a complete line of high quality turf products, but our most important product is SERVICE.

*(Betasan — registered trademark of the Stauffer Chemical Company).

IN OHIO
800-362-7413

Lakeshore carries a complete horticulture line — chemicals, seed, fertilizer, golf course accessories — as well as irrigation systems and parts. Bob Hobar and Jack Bruns discuss sprinkler refinements here. Bob and Skip Burkhardt work to design an individualized system.

Lakeshore

CO PRODUCTS

Meet the Lawn Care Team — Herb Cole, Ron Giffen, Bill Tanner, Art Wick, Harry Podvia, Lescosan and other LESCO Products including LESCO Sulfur-Coated Fertilizers.

Personal service keeps us growing.

Personal service keeps us growing. Lakeshore began 17 years ago as a small Ohio company. Now our Lescosan, our LESCO and other brand-name products are marketed nationwide.

At Lakeshore we take pride in our products, in our turf knowledge and in our ability to serve the needs of our customers. Need some Lescosan, a ChemLawn gun, some fertilizer, or a bedknife? Call us today. At Lakeshore we sell more than Lescosan. At Lakeshore we sell service.

NATIONWIDE
800-321-5325

LESCO Trucks make regular sales and delivery visits to over 3,000 golf courses and nurseries from Florida to Michigan. Although LESCO salesman Ed Williams is usually on the road with LESCO service, he stops back at the main office to restock and to discuss customer needs with Gene Probasco.

home office staff.

Please mark 55 on the Reader Service Card for more information.

Lakeshore — a name you can count on for quality... quality products, quality service.

Supervisors like Ag Industries Mfg.'s (a subsidiary of Lakeshore Equipment

& Supply Co.) Ron Smith and Dick Coleman formulate LESCO Sulfur-Coated Fertilizers with Lescosan at the Columbia, Alabama, facility.

Facilities like our fertilizer plant in Columbia, Alabama, and our new ware-

house planned for Wellington, Ohio, help make our service better.

Warehouse employees like Chuck Douglas make certain the products get from the warehouse to you.

Paul Morgan knows the accurate alignment and durability of bedknives is important. He works to improve the quality of Lakeshore's bedknives and replacement parts.

Phil Gardner, a former golf course superintendent, studies his customers' needs carefully before recommending specific products. Phil is proud to be marketing LESCO Fertilizers and CBS Certified Ryegrass Blend.

Lakeshore supplies Lescosan, replacement parts, tee and green accessories and LESCO turf and horticulture supplies across the continental United States and even in Hawaii and Australia. And we believe each customer deserves personalized service.

Call Lakeshore and ask for Barb. She will direct you to a turf specialist who can give you the answers you need.

Lakeshore is the turf company that got big by acting small. Started 17 years ago, Lakeshore now carries over 1,000 chemicals, grass seeds, replacement parts and golf course accessories. But a company is more than its product line. A company is the knowledge of the industry and products. A company is the attention of a salesman in tailoring a program to meet your needs. At Lakeshore we believe a company is as

good as its service and its people. At Lakeshore we have good service and good people. Ask our 10,000 customers.

You know the quality you can expect from Lescosan (Betasan[®]). That's the quality everyone at Lakeshore strives to put into each product we handle.

You know our products. If you don't know our people, get to know them — I think you'll like them.

Check out these energy savers from SOLO

SOLO's 426R riding mistblower is a rugged, lightweight 12.5-hp energy-saver for the fruit, berry, vegetable, or ornamental grower. Standard cleat or ATV tires.

PTO-driven 451/452 mistblowers cut hundreds of pounds from a tractor's load. 53, 80, or 105-gal. formula tanks available; centrifugal or piston pump. *PLUS . . . both save money too. SOLO mistblowers give better coverage with lower volume . . . better than any sprayer!*

- SAVE with 8-nozzle discharge, adjustable in direction, flow rate. Install TELEBLAST nozzle for 50-ft. radius coverage.
- SAFE no-drift herbicide application with optional spray boom or hand gun

the grass is greener on your side

with Bowie's HYDRO- MULCHER

For fast, easy turf establishment—the Bowie Hydro-Mulcher is the answer. The one-step operation of a Bowie Hydro-Mulcher plants, seeds, sprigs, fertilizes, waters, sprays and mulches. And with a Bowie Hydro-Mulcher, you can seed over three acres in fifteen minutes. That saves you valuable time and money! Order the Bowie Hydro-Mulcher—you'll have the best and greenest—on your side!

**Pennwalt—
A commitment
to clean water
for over 20 years.**

**Put it to work
for your customers.**

In more than two decades of commercial usage, Pennwalt aquatic herbicides have shown their effectiveness and compatibility with the environment, especially the ecological support systems of lakes, ponds, and streams.

Pennwalt aquatic herbicides kill water weeds and algae on contact*. And because these herbicides are based on a non-persistent compound—endothall—there is no bioaccumulation in the aquatic environment. Endothall breaks down in two weeks or less into carbohydrates—common constituents of plant life.

Pennwalt's Aquathol® K features a margin of safety to fish when properly applied, with little adverse effect on fish food organisms or the general ecosystem. Swimming can be permitted just 24 hours after treatment with Aquathol K or Aquathol Granular.

To fill all your needs, Pennwalt aquatic herbicides come in a variety of forms: ■ AQUATHOL® K Herbicide—in convenient liquid and granular forms. ■ HYDROTHOL® Herbicide/Algicide—in liquid and granular forms. ■ HYDOUT™ Herbicide/Algicide**—pellet form. Clean up your customers' water weed problems with the products that are backed by years of experience—Pennwalt aquatic herbicides. Interested in serving the aquatics business as an applicator? Let us help you with complete educational and technical support. Write or call for further information: Pennwalt Corporation, 1630 E. Shaw Avenue, Suite 179, Fresno, California 93710.

*Consult the label for species controlled and rates required.

**HYDOUT™ is available as a Special Local Needs registration in Florida, Alabama, Texas and Georgia.

We put a lot into our Turf-Truckster.

One of the most dependable vehicles for moving your crew around is the 3- or 4-wheel Cushman® Turf-Truckster. But it was also designed for more than just transportation.

Equipped with an optional PTO and hydraulic system, both models accept a wide range of special, add-on turf maintenance equipment. So with just one Turf-Truckster you can haul, dump, grade, seed, spray, spread, top dress, aerate and more.

But there's more to a Turf-Truckster than versatility. There's a rugged 18-hp engine that's built to take on your turf. It comes with a standard 2 to 1 auxiliary transmission. A transmission built to allow a gear driven PTO to be attached directly to it. And common sense engineering makes the Turf-Truckster steer clear of the repair shop, too.

The 3-wheel model gives you the maneuverability of a tight 17' turning circle, while the 4-wheeler has seating room for two. And it just takes minutes to

add any of the Turf-Truckster's accessory pieces, thanks to Cushman's pin-disconnect system. No bolting, no hitching. Just snap two or three pull pins in place and you're ready to hit the turf.

If a good transportation/hauling vehicle is all you need, though, look at the Cushman Runabouts. There's an 18-hp two-seater, and a fuel-stingy 12-hp one-seater model. Both Runabouts are economical to own. And like any Cushman vehicle, they're built tough.

There's nothing like a Turf-Truckster or Runabout to get more work done, in less time and with less manpower. For a closer look at what goes into, or behind, a Cushman vehicle, return this coupon today.

80-CUT-2

Show me what you put into a vehicle, Cushman.

- I'd like a demonstration of the Turf-Truckster (3-wheel or 4-wheel). (Circle One)
- I'd like a demonstration of the Runabout (12-hp or 18-hp). (Circle One)

I'm interested in seeing these Turf-Truckster attachments: Aerator; Sprayer; Top Dresser; Grader/Scarifier; Flatbed/Dump Box; Cyclone Seeder/Spreader.

Send me your new 1980 catalog.

Boots Hercules Agrochemicals Co. is marketing Nitroform, a high-analysis, organic, ureaform nitrogen (38-0-0) that soil microorganisms utilize. Field tests have shown that

when Nitroform is used as the source of nitrogen in a seed bed or fertilization program, a residual is established in the soil for sustained nourishment.

THE PROTECTORS

**for thousands of growers,
 nurserymen and landscapers...**

WILT-PRUF

...the proven anti-transpirant for over thirty years, keeps trees, shrubs, sod and indoor plants healthy. Protects against plant damage due to winter kill, transplant shock, wind burn, drought and air pollution. Concentrate is available in Pints, Quarts, Gallons, 5-Gallon, 30-Gallon and 55-Gallon sizes. Also available in 16 Oz. Redi-Spray.

SPRAY STAY

...sticker-extender - the perfect marriage between your spray and ours! Sticks sprays to trees, plants, crops and turf protecting against costly run-off due to rain or irrigation; prolongs adhesion and effectiveness of fungicides, herbicides, insecticides and pesticides. Comes in Pint, Gallon and 5-Gallon containers.

Note: SPRAY STAY and all WILT-PRUF products meet specifications of the Food and Drug Administration for use on edible crops. is 100% organic and bio-degradable; does not require registration with the EPA. is non-toxic to eyes and skin; and is not damaged by freezing.

For more information call or write Dept. WTT

Wilt-Pruf Products

P.O. BOX 4280 GREENWICH, CONNECTICUT 06830

**for thousands of consumers
 and indoor plant lovers...**

WILT-PRUF I

...for Christmas trees, wreaths and greens, to retard needle drop and reduce fire hazard; keeps them fresh for the entire holiday season! WILT-PRUF I produces a thin, transparent film substantially reducing excessive evaporation when evergreens are brought indoors. Comes in 10 oz. Redi-Spray.

WILT-PRUF II

...for indoor plant protection, helps plants from drying out and wilting. When sprayed on plant foliage, WILT-PRUF II provides a thin, transparent film which acts as a protective coating substantially reducing water loss during periods when excessive evaporation occurs. WILT-PRUF II helps the appearance of foliage by providing a slight gloss to the surface of the leaves. (Avoid using on plants with hairy leaves such as African Violets.) Comes in 10 oz. Redi-Spray.

Why this magazine and more than 750 others let us go over their books once a year.

Some magazines, we're sorry to say, keep their readers undercover. They steadfastly refuse to let BPA (Business Publications Audit of Circulation, Inc.) or any other independent, not-for-profit organization audit their circulation records.

We think the reason is obvious: These magazines are less than proud of the quantity and quality of their readers.

On the other hand, over 750 publications (like this one) belong to BPA. Once a year, BPA auditors examine and verify the accuracy of our circulation records.

This audit provides the name, company, industry and job title of every reader each publication reaches. The information helps advertisers to determine if they are saying the right thing to the right people in the right place.

It also helps somebody else important: you. Because the more a publication and its advertisers know about you, the better they can provide you with articles and advertisements that meet your informational needs.

BPA. For readers it stands for meaningful information. For advertisers it stands for meaningful readers. Business Publications Audit of Circulation, Inc.

A Great New LABOR SAVER ROSS TreeGARD™

Ross TreeGARD is a snap-on plastic tube that expands to fit any young tree. Snaps-off & on in seconds for bark inspection.

Protects trees from:

- Sun scald
- Rabbits and other rodents
- Mower bruises
- No taping, tying or gluing
- Allows proper ventilation

If your distributor doesn't stock ROSS TreeGARD™ order direct, freight pre-paid!

Lawn Smooth, Rock Tough VEMCO Flail Mowers

Talk about versatile! The Vemco Flail Mower keeps parks, and other large lawn areas smooth and streak-free. It also cuts rocky, trashy areas where ordinary mowers cannot go.

Standard Series mowers, with 42", 48" and 60" widths, have many construction features usually found only on heavy-duty models. Heavy Duty Series, with 60", 72" and 84" widths are tougher yet. Rock Dodger blades swing free in all directions, are practically immune to breakage.

We urge you to compare a VEMCO with any other mower in its class. You'll see the difference and like it.

SEPTEMBER 1980/WEEDS TREES & TURF

Chemicals

Estech General Chemicals Corp. has developed a new concept in slow-released turf fertilizers called IB-DU/SCU. The mix blends a three

nitrogen formula with sulfur-coated urea and water soluble urea to provide a three-stage release that lasts up to 90 days.

Creative Sales, Inc. has produced an in-store display that tells the story of the MEDICAP systemic implant. The

display contains the convenient "Ten-Paks" that are adequate to treat an average tree, plus ACECAP, a systemic insecticide implant.

Monsanto Agricultural Products Co. has developed Roundup, an herbicide for controlling a wide range of perennial and annual weeds and

grasses in one application. It can be mixed with water and applied with boom equipment, hand-held and high volume equipment (including knapsack sprayers), and shielded sprayers.

Say hello to **Sod-Saver**™ landscaping blocks...

and good-bye to turf damage!

- Made of heavy-duty molded plastic, resistant to water, acid, heat, and extreme cold.
- Easy to install and can be cut to fit with an ordinary saw.
- Load-bearing... provides a secure foundation for service and emergency vehicles.

Distributor inquiries invited.

36" x 12" blocks.
1 3/8" thick for normal use.
2 3/4" thick for heavy duty use.

Cutaway to show root growth.

Put the **LAWN GENIE®**
pick-up mower to work...
and **3** wishes come true

NOW YOU CAN...

1. Mow and vacuum all in one pass.
2. Use all year: thatch, clean up, mow, sweep leaves, mulch.
3. Change from mowing to thatching blades in seconds—no tools needed.

LAWN GENIE®

It's your turf. Keep it free of crabgrass, *Poa annua* and other annual grasses and weeds with America's leading preemergence herbicide for turf.

Dacthal

Dacthal is number one in its field. Not only because it is so effective, but because it controls more than 20 unwanted weeds and grasses. Applied properly, it lays down a barrier that stops early and late germinating annual weeds without affecting healthy, growing turf grasses. Tough weeds like crabgrass and Poa annua can't stand up to Dacthal.

The help you need for total turf care.

Dacamine® provides post-emergence control of over 70 broadleaf weeds, including dandelion, annual chickweed, knotweed and Canada thistle. It works right down to the roots so tough perennials don't return.

Daconate® is the post-emergence herbicide that knocks out nutsedge, chickweed, wood sorrel, sandbur and other grassy weeds. It's a ready-to-use liquid herbicide with a built-in surfactant for uniform wetting.

Daconil 2787® is the broad-spectrum fungicide that stops nine fungus diseases on greens and fairways. Use it from spring to fall to prevent dollar spot, leaf spot, red thread, stem rust of blue grass, large brown patch. It's effective even in hot weather. Provides effective disease control on a number of ornamentals.

Count on the big four from Diamond Shamrock to make your job easier.

Diamond Shamrock
The resourceful company.

Write 110 on reader service card

See your turf chemicals supplier, or contact the Diamond Shamrock Agricultural Chemicals Division sales office nearest you:

Groundsmaster 72.[®]

We engineered this Professional to mow up to 3.7 acres an hour without losing its cool.

Power to spare from a water cooled, 4 cylinder engine.

Clean, uncluttered operator station for maximum visibility.

Hydrostatic drive for smooth, one pedal control of forward/reverse.

An optional rear discharge cutting unit which directs clippings down between the wheels is now available.

Donaldson air cleaner for longer engine life.

Deck offset 18" for mowing under limbs, trimming near fences, trees.

If you're responsible for large areas of turf, you have grounds to buy our Groundsmaster 72.[®]

In fact, Toro engineered this rugged 72" rotary specifically for your needs.

We built-in plenty of power for all types of cutting conditions.

We made its engine water cooled to give you longer service life.

We designed it to trim close to fences, walls, buildings and trees.

And we added versatility. With optional accessories including a 48" snowthrower, V-plow, rotary broom, roll over protection

system (ROPS), and cab with ROPS.

Want a demonstration of the Groundsmaster 72[®]? Or our Groundsmaster 52[®] that mows like a garden tractor and trims close like a walk mower? Call your Toro distributor. Or, mail the coupon.

TORO[®]

The Professionals[™]

Tell me more, Toro.

I'm interested in a free demonstration of the Groundsmaster 72[®]. Please have my distributor call me.

Singlehanded, you can whip fuel and labor costs with **EXCEL HUSTLER** *pure motion* at your fingertips.

To groundskeeping pros, EXCEL HUSTLER means Mower—and More—every season.

Two hydrostatic pumps transmit direct to drive wheels instantly in response to fingertip touch on twin hand levers. Dual pumps work only half as hard, last many seasons longer for added value and less downtime. But there's More: *Instant pure motion* moves the big mowers easily around trees, park benches, markers, and other mowing headaches. EXCEL HUSTLER owners mow More acres per hour. More grass per gallon. More years per mower!

The Mower delivers a super cut on fine turf or rough. Choose air-cooled 275 or 285; liquid cooled

295. Standard or heavy duty 72" rotary, 54" rotary, or 60" flail.

More turf and grounds attachments: Cultivator, Catcher/Compactor, Edger, Dozer Blade, Rotary Broom, amazingly efficient Snow Thrower. Add ROPS; enclose cab for winter comfort; Tilt-Deck Trailer for transporting.

And More! Factory trained service and parts through your EXCEL HUSTLER Distributor. Write or call for his name and free literature, or watch for a field demo.

The only way
to improve **baron**
was

baron
KENTUCKY BLUEGRASS

to
lower
the
price.

So
we did!

Now, no matter how much (or how little) Baron you buy, you'll pay $\frac{1}{3}$ less than before. It's our way to thank you for making Baron the world's largest selling bluegrass.

It's possible because, unlike other elite bluegrasses, Baron consistently produces large quantities of seed. And that means Baron is always available.

It's still the same great Baron . . . with the same quick germination, dense growth and rich color that looks great in sun or shade. It resists diseases and requires minimal fertilization. And, of course, it's certified and free of both *Poa annua* and bentgrass.

Baron is still the same. **\$1.49/lb.***
Only the price is lower!

*Gold Tag (sod quality) is available at \$1.59 per pound.

Prices slightly higher in Canada.
These new crop prices available
September 1, 1980.

Drainage

Waterlogged or submersed turfgrass can be severely damaged in less than two weeks, longer during dormancy. Standing water should be eliminated by filling in low spots, grading to control surface runoff, or installation of drainage tile. If drain tile is the choice, they should be installed in a branched pattern 15 to 30 feet apart with a minimum slope of .5 to 1 percent, at a depth of two to three feet, shallower in sandy soils. The best backfill is washed sand to the surface. If the subgrade is relatively impervious to water, but lower layers are fine, drilling or shallow slit trenches may solve the problem.

If major modification of the root-zone is planned, subgrades can be sloped toward spaced tile or perforated plastic pipe for even distribution of drainage. Rootzone designs usually call for coarse sand over the tile with a layer of topsoil on top mixed to specified texture.

Drainage may also be impaired by thatch, hydrophobic soils, and hard water. Thatch removal, soil aeration, and water conditioners can im-

Types of trenches. Turf will grow over sand to conceal drainage trenches.

prove infiltration. Depth of topsoil affects drainage since shallow layers of topsoil will tend to saturate faster than deeper layers.

For proper surface drainage slopes should be more than one percent but no more than 20 percent.

Shade

Turfgrass cannot be healthy under conditions of light stress. It requires enough light for photosynthesis to produce the needed quantity of carbohydrates for plant growth and

97

maintenance. Furthermore, plants prefer blue regions of light to others. The intensity of the light may be limited by the time of day the plant receives full sun, the angle of the plant surface to the sun, and the length of time the plant is exposed to sunlight.

Excessive shade causes reduced growth, reduced spreading by stolons and rhizomes, limited root growth, depletion of carbohydrate storage, less wear tolerance, and thinner turfgrass stands.

Other factors of excessive shade are high surface humidity encouraging disease, lower soil temperatures likely to delay emergence from winter dormancy, and competition with trees for nutrients. Creeping red fescue and velvet bentgrass are most shade tolerant of cool season turfgrasses. *Poa trivialis*, creeping bentgrass, and tall fescue have fair shade tolerance. Kentucky bluegrasses are notably shade intolerant, however, some cultivars exhibit improved shade tolerance such as Glade and Warren's A-34.

St. Augustinegrass is followed by zoysiagrass in shade tolerance in warm season turfgrasses. Bermudagrass is also notably shade intolerant.

Removal of lower branches and thinning of limbs is one alternative to removing entire trees to obtain more light. Use of turfgrass in areas of permanent shade is fruitless, such as northeast corners of buildings or walls.

Air Circulation

Trees and structures can restrict air circulation over turf areas. Turfgrass releases moisture by transpiration through leaves. If this moisture, heavy dew or moisture from rainfall or irrigation is not controlled, the environment for many turf diseases is improved. That is why morning irrigation is favored over evening irrigation. Air movement helps moderate early afternoon soil temperatures for grasses in full sun.

On the other hand, too much wind can desiccate exposed leaf surfaces, increase the chance of winterkill, and prevent adequate moisture from reaching the soil.

As mentioned earlier, shortage of carbon dioxide on the soil surface is rarely a problem.

Irrigation

If fine turf is the objective, irrigation of some form should be included

Spray heads have fewer moving parts than rotary heads (inset) but are initially more expensive.

in the site plan. Discussion with the customer or landscape architect will establish the commitment by the owner for fine turf. Without irrigation the customer can expect periods of summer dormancy, eventual transition to more drought tolerant and low fertility tolerant grasses such as tall or red fescue, and less control over seed germination after planting.

James Watkins writes in his book *TURF IRRIGATION MANUAL* that the relative cost of irrigation system choices is in a ratio of 4:2:1 (spray systems; rotary systems; and quick coupler systems). He advises that cost is only one consideration and each type of system should be evaluated for a particular site.

At the least, an irrigation design consultant should evaluate site drawings for approximate cost and water requirements. A well may be needed or a pump system for a lake. Today, irrigation installation is considerably less disruptive to a site.

Vibratory plows and plastic pipe greatly reduce turf damage.

Drip irrigation is an alternative to shrub heads for some sites. The drip lines cannot withstand surface disturbance. If an underground system is installed for the turf, an extra zone for shrubs may be more practical than a separate drip system.

Extra care during seeding or sodding is required around irrigation heads. Heads should be properly installed to prevent puddling around heads and to assure clearance of turf after installation. Controls, pumps and valves should be secured to prevent vandalism or theft.

The landscape contractor should find a reputable irrigation designer to handle subcontracts. A good relationship will help the installation look its best for a long period of time. The customer must be clearly apprised of the maintenance needs of the irrigation system and the proper use for good turf care.

Soil Preparation

The most common state of a site when the contractor arrives is the topsoil has been replaced and rough graded. It is not unusual for the contractor to see the need for further grading, backfilling curbs, foundations, and perhaps trenches that have settled; and additional topsoil where needed.

If topsoil has not been replaced, the contractor has the opportunity to

amend and mix the topsoil to optimum conditions. A soil shredder or mixer can simplify this task. He also has the opportunity to grade the subsoil for improved drainage if necessary.

Musser and Perkins of Pennsylvania State University recommend in TURFGRASS SCIENCE that the topsoil mix consist of one part peat, four parts sand, and five parts topsoil. It should be well mixed and

spread to a depth of at least six inches.

If topsoil is already in place, amendments can be added and mixed with a cultivator. Overworking the soil can break down aggregates and destroy the soil texture. Also, soil preparation should not be attempted in wet weather to prevent compaction. Limestone and phosphorus do not leach readily and should be incorporated with the top-

SYDSPORT

Kentucky

Bluegrass

Protects high wear turf areas. And your reputation.

Some turf can't be pampered. It's there to be used and enjoyed. But this places growing stress on the turf. And stress on your turf growing reputation.

Sydsport is an effective answer. With good seedling vigor and rapid development, Sydsport establishes itself quickly. Active rhizomes promote a very dense rich green turf. Vigorous growth continues late into the season to aid recovery from wear and damage before the turf goes into winter dormancy. Proven winter hardiness brings Sydsport through, ready for another active season.

When you need no-pamper turf, seed Sydsport. Vigorous Sydsport protects high wear turf areas. And turf growing reputations.

NEW ...from Princeton

The "Piggyback" Material Handler

It's Powerful ... Safe ... Versatile!

Princeton's mighty "Piggyback" has solved many of the problems that have always plagued heavy-duty, field quality material handlers. The remarkable "Piggyback" is light...strong...fast...durable...AND completely stable on the job!

The Piggyback will lift and load up to 4500 lbs. at a time ... turn quickly in its own length ... navigate curbs, logs, and other obstacles with ease...trudge through gravel, sand and mud, but float over normal soil...and then load itself onto your truck for a piggyback ride home at the end of the day.

How is it Possible?

The Princeton "Piggyback" provides an extremely low ratio of weight to carrying capacity...with complete stability. Stability is achieved by carrying the load weight between the drive wheels instead of in front, as with other fork lifts, and by special hydraulic stabilizer legs. Load is lifted to truck bed height, then rolled over truck bed by a horizontal carriage. Heavy-duty high torque wheel motors allow the "Piggyback" to operate on steep grades or in adverse ground conditions and to drive easily over normal loading area obstructions while fully loaded.

The Piggyback's 28 h.p. Murphy 2-cylinder diesel provides superior power for all adverse operating conditions.

Loaded for Piggyback ride home.

Sod Production and Topsoil Loss

The present day concern over topsoil loss to erosion has expanded in some areas to a concern over soil depletion by sod production. In fact, some sod producers claimed soil depletion allowances in 1978 before the American Sod Producers Association convinced Congress that such allowances did not fit the practice of harvesting sod. Had ASPA not obtained this exemption for sod producers, they would have been forced to implement an inventory system of accounting for tax purposes.

Great strides have been made in reducing sod thickness over the last 20 years. Researchers and sod growers have proven the benefits of thinner sod. Thinner sod roots more rapidly and cuts transportation and handling costs. Sod thickness is today primarily a function of sod strength. Knives are set just low enough to prevent scalping on uneven spots in the fields.

Research by Skogley and Hesseltine at the University of Rhode Island has identified harvesting method and the age of a stand as the main factors in sod thickness. Three-year-old sod could be cut at slightly thinner thicknesses than two-year-old sod. The machinery's ability to handle uneven fields can reduce the thickness further.

Actual blade adjustment may seem minute, but a 1/16-in. higher setting could save six tons of soil loss per acre.

Production of sod, as compared to other agronomic crops, actually improves the organic matter content of the soil by two percent per harvest. This is due to the fact that most of the turfgrass roots remain in the soil after harvesting and decompose.

Skogley and Hesseltine found that sod production removed less topsoil than many other crops. Wind and water erosion are greatly reduced by grass cover as opposed to open crops such as corn, soybeans, and cotton. Planting winter wheat often provides farmers with reduced winter topsoil loss.

Topsoil removed during sod harvesting is less than many conventional agricultural crops.

A Step Ahead. **FYLKING.**

When this low-growing, Swedish lawn beauty first stepped into the turf world it revolutionized the lawn industry.

Now another step! Fylking Kentucky bluegrass costs less than most other elite bluegrasses!

Fylking establishes fast, develops a greater density of rhizomes and root system. Fine-textured, velvety green, Fylking performs well when cut low (even low as one-half inch), and may need less mowing. Amazingly tough, Fylking Ken-

tucky bluegrass has improved disease resistance to leaf spot, stripe smut, stem rust and leaf rust, as rated in tests by many major universities and institutions. Physically pure, genetically true seed, Fylking contains no annual bluegrass (*Poa annua*), bent grass or short-awned foxtail.

Take a giant step ahead by using Fylking as the backbone bargain of your next lawn turf mix. Ask for the Swedish beauty, Fylking Kentucky bluegrass at your local wholesale seed or sod distributor.

FYLKING KENTUCKY BLUEGRASS

U.S. Plant Patent 2887

NEW!
ECLIPSE
 earth office roof lawn
 adds beauty, saves energy!

Plant variety protection applied for.

New ECLIPSE Kentucky bluegrass was chosen to cover the roof of Central Pre-Mix Concrete Company's new underground, two-level concrete office building. With 8000 square feet on each level, 33% savings on heating costs is expected. No air conditioning is installed because of the earth's 40° to 60° temperature range. A large heat pump utilizes earth cooling and heating. The sprinkler system is controlled by humidity requirements of grass roots.

ECLIPSE Kentucky bluegrass covers the roof and is destined to be a leader. It germinates fast and performs well in sun or shade. Shade test trials proved ECLIPSE better than many varieties on both East and West Coasts. Developed at Rutgers, ECLIPSE has excellent stem rust resistance, improved resistance to the Fusarium blight and the dollarspot disease. Dark green, medium-textured ECLIPSE is a good base for sod blends and turf seed mixtures.

ECLIPSE Kentucky bluegrass seed available exclusively from:

soil if soil tests indicate a need. It is also a good time to mix in potassium and minor elements. Nitrogen need not be added at this time.

If there is a delay between rough grading and seeding, weeds will have emerged. Although the process of fine grading will kill most of the weeds, persistent grassy weeds can cause problems later. Most herbicides take two weeks or longer to dissipate after application. Roundup can be used on problem weeds if necessary and will dissipate within three days. Soil fumigants can be used for control of weeds, nematodes and insects if desired. Seed can usually be planted two or three days after fumigation. An advantage of fall seeding for cool-season grasses is the aggressiveness of the turfgrass in relation to broadleaf weeds during cooler, sunny days. Spring seedings face a strong challenge from broadleaf weeds during summer. Spring is often the preferred time for warm season grass seeding.

Just prior to seeding a complete fertilizer should be applied. Approximately one pound of nitrogen per 1,000 square feet can be soluble in

form, with the remainder in slow-release form. Enough slow-release nitrogen should be applied to delay a second fertilizer application for six to eight weeks. The starter fertilizer should contain adequate levels of phosphorus and potassium since the seed is close to the surface. The turfgrass won't take advantage of the phosphorus mixed into the topsoil beforehand until it roots. Phosphorus will not leach or move to the surface.

Seeding

Two overlooked factors in seeding are the number of seeds per pound and the difference between spreading and bunch type grasses. One misconception in seeding is the idea that if one rate is good, a higher rate is better. This is related to the idea that seed is cheap in comparison to proper soil preparation.

A good lawn is constructed like a good house, from the foundation up and with good materials. Short cuts in the beginning cannot be overcome later. Constant repair could keep the lawn alive but can easily exceed site alterations or soil amendment in

cost.

Assuming the seedbed was properly constructed, the seed rate should be determined by seed count. Seed count varies according to species and cultivar. (see table). Beard in his textbook TURFGRASS SCIENCE AND CULTURE specifies the number of seeds per square inch for North American species. If that number is applied to the total area of the seedbed and divided by the number of seeds per pound, a seed rate in pounds per acre can be determined. Each component of a mixture can be figured by seed count to derive an appropriate rate for a mixture. Lower rates for spreading grasses can be used. Sod producers often use lower rates for Kentucky bluegrass than a landscape contractor would.

For bunch type turfgrasses, such as tall fescue and perennial ryegrass, seed count, adjusted by germination percentage, should be slightly higher than the number of shoots present in a mature stand. This would mean roughly 15 seeds per square inch for tall fescue and perennial ryegrass, which works out to be about eight pounds per 1,000 square feet. Ken-

tucky and rough bluegrass can establish satisfactorily at one pound per 1,000 square feet. Bentgrass will succeed at one half pound per 1,000 square feet.

Higher seeding rates can actually cause the turfgrass to crowd itself and to compete for light and nutrients. Weakened seedlings are more prone to disease and insects than seedlings from correct seed rates. The hurry to establish a turf cover may not be worth the weakened turf caused by higher seed rates.

High seed rates are not insurance. The recommended rate is also the cheapest rate. Excessive amounts of seed discourage the use of improved cultivars due to cost. The cost of tall fescue is not a great deal cheaper when the seed rate is multiplied by the cost per pound.

If erosion by rain or wind is a concern with the seed rate, the correction should be in the method of seeding or in the use of mulch rather than the increase in seeding rate. If slopes are extreme, netting or sod should be considered over standard seeding.

For best germination seed should be covered with one quarter to one half inch of soil. Surface seeding is not as effective. Soil retains moisture better than most mulches and supplies the seedling with water following germination. If a mixture of seed is used, a centrifugal seeder will not provide even distribution of all seed types. Drop spreaders or a cultipacker are preferred. The seedbed can be rolled after seeding to improve soil/seed contact.

Many types of mulches are available for water retention and erosion control. Rates vary with the product. Straw and an asphalt binder can be used. Clean straw must be used to avoid contamination by forage grasses.

Fall is the preferred time to seed. Rainfall, temperature and other factors cause this to be the best time. Seeding at other times will require backup irrigation, greater weed competition, and higher seedling mortality. Sod may be a better choice for late spring and early summer lawn installation.

Sod Transplant Rooting Characteristics of Several Kentucky Bluegrass Cultivars/(Transplant Rooting Measurements Were Made 21 Days After Sod Placement)

Nobody else builds power rakes like Ryan.

For more than 18 years, the Ryan Mataway® and Ren-O-Thin® power rakes have set increasing standards of toughness, durability and performance. Here's why.

(1) The Mataway's self-propelled upmilling action and 19" swath lets you cover up to 10,000 sq. ft. per hour;

(2) Snap-in blade sets offer normal, wide or narrow slicing;

(3) A hefty 10-hp engine gives the Mataway muscle; (4) A micro-screw adjustment gives cutting depth control that's precise enough to deep slice greens accurately; (5) The Ren-O-Thin cuts a wide 18" swath; (6) A floating front axle follows the contours of your turf; (7) Choose the gutsy

7-hp Ren-O-Thin IV engine, or the economical 5-hp Ren-O-Thin III; (8) All Ryan power rakes are built to deflect debris from the operator as they power rake.

With operating costs constantly rising, you need to get the most out of every hour's wage you pay. That takes a dependable crew, using dependable equipment.

Like the Ryan Mataway and Ren-O-Thin.

Ask your Ryan dealer for a demonstration, and see for yourself how we build power rakes.

Sod Installation

Sod, the instant lawn, is the fastest method of lawn establishment available. It is also the most expensive.

Soil preparation is the same as for seed. Sod must be handled quickly and kept moist. The best sod for a site is one that was grown on soil of the same texture. The soil should be sprayed lightly just prior to laying the sod. After the sod is down and trimmed, it should be rolled and perhaps topdressed at edges and joints if necessary. The sod should be soaked thoroughly two or three times per week for at least four weeks. Some turfgrass sods knit more rapidly than others. These sods should be specified for areas where use is anticipated soon after installation, such as athletic fields or greens.

Sod should be irrigated regularly

throughout its first season. It has received high levels of maintenance at the sod farm and has adjusted to frequent water and feeding. Sod producers select aggressive cultivars for fast knitting and growth. Like any fine lawn, sod represents a commitment to maintenance and must receive it to remain healthy. Sod in shady areas will take longer to knit than in full sun. Sod for shaded areas should contain shade tolerant cultivars.

Sod can be staked to slopes where erosion and seeding failure are more likely. Ditches designed to carry infrequent runoff may also be sodded.

Vegetative Planting

Vegetative plantings can produce a mature turf stand more rapidly than seeding. They too cost more than seeding, but less than sodding.

Verticutting (above) is an essential step in lawn renovation to obtain satisfactory seed/soil contact and to avoid seed germination in the thatch layer.

Aerification (bottom) improves drainage and air penetration and reduces the chance of compaction by traffic. One extra step is to sand topdress into holes.

TWO GREAT GAMES ONE GREAT GRASS

Super Bowl XIV and the Rose Bowl classic were the great games. The turf? That was Derby Turf-type perennial ryegrass.

Derby was selected by George Toma, the man responsible for the Super Bowl XIV turf and Gus Huntly, turf manager for the Rose Bowl game, because of the special requirements for these special games.

Toma and Huntly wanted a fast-germinating, dark-green, handsome grass as well as one tough enough to take a pounding and still look great for the television cameras.

And Derby did it all. Of course, it will do more. It mows beautifully and thrives when cut at 1½ inches or at 3/16 inch on golf greens. In Southern areas it's a top choice for winter overseeding of golf greens.

Derby is also a great mixer, combining with the fine fescues and bluegrasses to form an outstanding turf.

HERE'S WHAT DERBY WILL DO

- *Persists in heavy, compacted, poorly drained areas where traffic is not intense*
 - *Tolerates a wide range of soil types from heavy clay to sandy*
 - *Retains its deep green color during chilly Southern winters*
 - *Germinates in less than a week under ideal conditions*
 - *Thrives when cut to 3/16, 1 inch or 1½ inches*
 - *Mixes nicely with fine fescues and bluegrass*

Labor needs are greater than seeding.

Once again, site preparation is the same as for seeding. Sprigs are planted in 8 to 12 inch rows in three-inch deep slits. Two to four bushels of sprigs are needed for each 1,000 square feet. Stolonizing involves broadcasting stolon segments onto the prepared seedbed. The stolons are then topdressed with fine soil of the same origin as the seedbed. Broadcast planting takes five to ten bushels of stolons per 1,000 square feet.

Plugging is a third alternative. Like sod, best results are obtained if the soil in the plugs is similar to the seedbed. Rows 12 to 16 inches apart are planted.

Shade, lack of moisture, and inadequate fertilization will slow the spread of the vegetative material. Warm-season grasses have the advantage of remaining aggressive in comparison to many weeds during warm months. Vegetative plantings are monostands. Stolons of other grasses can infest a planting, especially in broadcast planting. Nurseries are certified by many states to assure that vegetative material is

only of the desired type for the particular job.

Renovation

Renovation is becoming more popular as a method to improve existing turf stands. Roundup has shortened the process with its near lack of residual activity.

It is done either by seeding or sprigging into existing turf stands that have been treated. Soil improvement is limited to aerification and topdressing if done. Thatch should be removed with a thatcher or verticutter. Cores should be broken up and a starter fertilizer applied. Seed is applied and brushed or rolled to assure surface contact. If preferred, the seed could be lightly topdressed.

The area should be watered just as a normal seedbed following seeding. The existing vegetation provides some protection against erosion but does restrict full light from reaching the seedlings. Shaded areas may not respond to renovation. Soil is not appreciably better than before renovation either. It is a partial solution and may not reduce maintenance levels or correct basic soil deficiencies.

Overseeding

Overseeding for winter transition or turf improvement is perhaps the fastest growing use of turfgrass seed. It is renovation without killing the existing turfgrass.

Cool-season turfgrasses are overseeded into warm season grasses as they go dormant in the winter. Turf texture and color are retained throughout the winter months. Upon return of warm weather, the warm season grasses come out of dormancy and dominate the cool season turfgrass.

Overseeding with similar turfgrasses is also feasible. Thin stands of Kentucky bluegrass can be verticut, closely mowed, and seeded with improved varieties. This is a less expensive way of adding disease or shade tolerant cultivars to older bluegrass stands.

High rates of seed are used in overseeding. Mortality is higher for seedlings in overseeding. Seeding rates double that for regular seed establishment are common. Seed can be lightly topdressed. Traffic should be restricted in the area if possible. In some cases fungicides are applied soon after overseeding to improve germination and survival.

FLAIL SAFE

When your job is grounds maintenance year around, you need a mower for all seasons.

With one **VERSATILE** Mott mower, you can mow fine lawns, shred high grass and weeds, mulch leaves and renovate.

Flail type mowers have a reputation for being **SAFER** than rotary type mowers. Mott mowers... with their lightweight knives... are the safest of the flails.

Mott mowers also offer **COST EFFECTIVE PERFORMANCE** because they last longer and are more reliable to operate.

Write or call for information about **YOUR MOWING REQUIREMENTS**. This season and every season, mow Flail Safe... with Mott mowers.

"Tell me more about FLAIL SAFE mowing."

**Charles Craig put his
career on the line to
use Roundup[®] herbicide.
And he won.**

When Charles Craig decided to renovate 35 acres of this college campus with Roundup[®] herbicide in 1977, he knew that if it didn't work, he'd probably have to "hide under a rock."

But, fortunately, Charles didn't have to go into hiding because just 7 days after he applied Roundup he was able to reseed right into the dying grasses.

"Yes, I put my career on the line, but I felt all along that Roundup was going to work," Charles says. "There was no doubt in my mind!"

As horticulturist for Mercer County Community College in Trenton, New Jersey, Charles Craig depended on Roundup for the broad spectrum control

he needed for tough grasses like quackgrass, orchardgrass, tall fescue and others. And since Roundup has no residual soil activity, he was able to reseed in a matter of days.

"Seed germination was terrific, especially with the weather we had," Charles told us. "Everyone always says it looks nice."

Charles still uses Roundup for touch up jobs around cracks in the pavement, parking lots, buildings, tree bases and flower beds. Taking precautions against spray drift, Charles has no fear of harming surrounding vegetation with Roundup.

Charles Craig is convinced that Roundup works, and he has 35 acres of beautiful turf to prove it.

To see how it can work for you, reach for Roundup where you buy chemicals.

For literature, call 1-800-621-5800, or in Illinois, 1-800-972-5858.

Monsanto

**There's never been
a herbicide like this before.**

“Regal rye, I presume?”

The best-looking grass in Kansas City can be found, of all places, at the Harry S. Truman Sports Complex. Regal perennial ryegrass can be found here—in the landscaping around Arrowhead Stadium, as well as in the football practice field. Overseeding the Baron and Ram I bluegrass in this field with a team of perennial ryegrasses, including

Regal, produces a playing surface that withstands the almost daily wear and tear by tough Kansas City Chiefs. The result, according to George Toma, Director of Field and Landscaping Operations, is a truly tough yet beautiful turf.

Don't you have a place for Regal turf-type ryegrass?

unionization.

Rich Brolick, Zelenka Evergreen Nursery, Inc., Grand Haven, MI, spoke about problems with migrant labor. His company has spent over a million dollars in migrant facilities. "The key to the whole migrant program is the housing," said Brolick.

In addition to the sessions, John B. Wight, Jr., president and chairman of the board of Wight Nurseries, Inc., Cairo, GA, was elected president of AAN, replacing Hugh Steavenson, president of Forrest Keeling Nursery, Elsberry, MO.

The AAN inducted John J. Pinnery, Ottawa, KS, into the Nurserymen's Hall of Fame. It also presented two national awards to Harold Davidson, professor of horticulture at Michigan State University, for his nursery research contributions and effective teaching in horticulture.

To commemorate the convention, the AAN held a tree planting ceremony at the Nelson Gallery of Art and Atkins Museum in Kansas City.

LAWN CARE

New officers elected for Lawn Institute

Norman Rothwell of N.M. Rothwell Seeds, Ontario, Canada, has been recently elected president of the Lawn Institute, and 18 new members have been elected to the Board of Trustees.

Other members serving with Rothwell will be Robert Peterson of E.F. Burlingham & Sons as vice president, and Robert Russell of J & L Adikes, Inc. as secretary-treasurer.

The Lawn Institute, sponsored by lawnseed breeders and growers, is a nationally recognized source of information concerning lawngrasses.

PROMOTIONS

Toro promotes Adams to new position

The Toro Company recently promoted

James W. Adams to the new position of senior vice president, International Operations, joining Toro's six-member executive management committee.

Since starting with the company in 1974, Adams has been a group vice president of Toro's irrigation operations.

COMPANY

International Harvester changes co. name

International Harvester, Payline Group, has altered its name to Construction Equipment Group.

The new name is expected to improve worldwide recognition of the International Harvester Co. products for which this group has manufacturing and marketing responsibilities.

A remarkable innovation in FORK LIFTS

The SPYDER ... versatile, flexible, maneuverable.

PORTABILITY: Can load itself on rear of truck or trailer bed or attach to custom designed trailer for towing behind car or pick up truck.

WEIGHT: Approximately 2700 pounds.

CAPACITY: Carry over 3,500 lbs. Comparable to 12,000 lb. Fork lift.

PERFORMANCE: Can outperform, outmaneuver, and out maintain any other fork lift.

OPERATION: Operates in rough terrain and muddy conditions.

STRENGTH: Exceptional strength comes from total hydraulic system and ability to balance load.

Climb on something stronger

Arbor-Plex™

Arbor-Plex™ climbing, bullrope

Arbor-Plex™ 12-strand . . . designed specifically for climbing and bull rope applications. Arbor-Plex™ has been extensively tested in the field and has proven itself with these advantages:

- * Twice the strength of manila
- * Duron® II polyester for durability
- * Firm "nubby" surface for good grip
- * Lightweight, throws well
- * Good knot holding
- * Torque free, non rotating
- * Green stripe for easy identification
- * Resists chemicals and UV, won't mildew

Arbor-Plex™ is available through Samson Distributors. Send on company letterhead for descriptive literature and a **Free** six foot sample of 1/2" climbing rope. Samson, Dept. AP, 99 High Street, Boston, MA 02110

WT&T

VEGETATION MANAGEMENT

By Roger Funk, Ph.D., Davey Tree Expert Co., Kent, Ohio

Q: What is the best chemical to control cottony maple scale on silver maples?

A: We use primarily a combination of malathion and and sevin during the crawler stage (July in the Northeast). Field studies have shown similar results with Diazinon.

Q: I read where dormant oil will remove the blue color from Colorado blue spruce. Is the loss of color permanent?

A: It has been our experience that the blue color, which is a waxy exudate, normally returns within a month.

Q: How do you treat the soil to prevent root graft transmission of Dutch elm disease?

A: According to the Vapam label from Stauffer Chemical Co., dilute one part Vapam to three parts water. Drill holes approximately 3/4 to 1 inch in diameter, 15 inches deep, and 6 to 9 inches apart. Fill each hole with diluted Vapam to within 2 inches of the soil surface.

Make a line of treatment sufficiently long to kill all roots of the adjacent trees that are likely to be root-grafted. Apply the chemical slowly and carefully to avoid overflowing the drilled holes and tamp each hole until closed. Allow at least two weeks after treatment before removing the diseased trees.

Q: I recently came across the term LC_{50} and thought it was a misprint for LD_{50} , but I have since seen it again in print. I have not been able to find anyone who knows what it means (if anything). Can you help?

A: LC_{50} is the median lethal concentration rather than the median lethal dose (LD_{50}). It is often used to measure the toxicity of a chemical present in air or water.

Q: Do fungicides protect turfgrass growth that occurs after the application?

A: Contact fungicides do not. Systemic fungicides are absorbed by the roots and translocated throughout the plant system. Newly emerging leaves may contain sufficient concentrations for protection against certain infectious organisms.

Q: How long do you have to wait to reseed a lawn after applying broadleaf herbicides?

A: In general, a waiting period of three to six weeks is recommended before reseeding since these herbicides can cause seedling injury.

Recent research has shown that when using a slicer-seeder herbicides could be applied at or prior to seeding with no significant reduction in turf stand.

It's obvious... you can depend on a National

It's easy to check our best features. We don't cover 'em with a shiny shroud. **What you see is what you get...** a completely functional and easily maintainable machine built with a minimum number of components. National's 84-inch Triplex offers the same superb performance on hillsides or level ground. Three, power driven, free-floating reels follow ground contour and cut without skip or scalp. Reels adjust down to fixed bed bars providing for more rigid and longer lasting mowing units. Bed knives have turned up lips for extra wear... a feature we introduced as early as 1925. National's no-nonsense design makes normal service faster than any mower on today's market.

Check out the economies of National's ugly beauties. We've been adding nothing but quality since 1919... it's obvious!

Model 84 Triplex

**Power
Quint**

Deliberately designed to provide its own power source which allows unit to be pulled by almost any size tractor with or without PTO. Five, free-floating, powered reels cut an 11½ foot swath. Wings fold to 68".

68" Triplex

Low center of gravity and wide track provide great maneuverability. Mows a 68-inch swath at speeds up to 4 mph... that's half an acre in 15 minutes. Wings fold to 37½".

JUNIPERS THRIVE IN VARIOUS SOILS, SUIT MANY PLANTING DESIGNS

By Douglas Chapman, Horticulturist, Dow Gardens, Midland, Mf

If used correctly, cultivars of juniper (*Juniperus chinensis*, *communis*, *horizontalis*, and *sabina*) and Eastern Redcedar (*Juniperus virginiana*) can add variety and low maintenance to the landscape while being tolerant of urban conditions. Their ultimate height varies from 6 inches (native *Juniperus horizontalis*) to 40 feet (Eastern Redcedar). Junipers thrive in conditions varying from swamp-water sand (Eastern Redcedar) to well-drained rocky sites. They will grow in the shade of a swamp or full sun of foundation plantings.

Juniper thrives in soil conditions from well-drained sand to heavy, yet well-drained clay. The pH can vary from 5.0 to 7.0 with little problem. Junipers can be used in mass plantings, hedges, shelter belts, foundation plantings, and rock gardens, in fact, almost any application. They thrive in full sun while only tolerating partial shade, in fact, becoming open and leggy in shady conditions.

The insects and diseases are many, including cedar apple rust, twig blight (*Phomopsis juniperovora*), web worm, scale, mites, and bagworm (in Illinois, Indiana, and Missouri), but only a few are catastrophic. The catastrophic pests are twig blight (*Phomopsis juniperovora*), scale and mites.

There is a tremendous varietal variation as to *Phomopsis* (twig blight) resistance, not only between cultivars but also geographic locations in the landscape. This tremendous variation of susceptibility has been surveyed by many of the land grant colleges. When designing a planting, checking with your local Cooperative Extension Service for an approved list is paramount. A few of the most resistant juniper varieties, as reported by Laemmlen, Michigan State University, included *J. chinensis* 'Ames,' 'Armstrongii,' 'Fairview,' 'Hetzii,' 'Keteleeri,' 'Mountbatten,' 'Pfitzeriana,' 'Pfitzeriana Aurea,' 'Pfitzeriana Compacta,' *sargentii*, *procumbens*, and to a slight extent, *procumbens* 'Nana'; *J. horizontalis* Douglasii, 'Emerald Spreader,' and 'Wiltonii'; and *J. sabina* 'Arcadia,' 'Broadmoor,' and 'Von Ehron.' Moderate success has been achieved when spraying several times (two minimum) with Benlate and a wetting agent. Use of chemicals during a cool, wet spring, when the disease is rampant, has met with varying results.

Scale and mites can be severe problems. Many junipers that stop growing are suffering from a severe mite infestation which occurs during the heat of summer. Control is relatively easy with a miticide or ovicide when a slight yellowing or bronzing of the foliage becomes apparent, symptomatic of a heavy infestation.

The only effective way to discuss junipers is by cultivar. The over 170 cultivars available in the trade, as reported by Wyman, make this an exciting yet confused group. Further, each year additional varieties are being selected and introduced.

Therefore, one should be continually trying new cultivars to add resistance and variety in the landscape. The following discussion of cultivars is designed to assist landscape architects and grounds managers make effective decisions, reducing maintenance while improving the quality of the landscape.

Chinese Juniper (*J. chinensis*) is an exciting juniper when considering the many cultivars. They range in height from 12 inches to 15 feet, prefer growing in full sun, and display a broad range of exciting greens in landscapes.

'Ames' has a steel blue foliage, turning somewhat paler green with maturity. Initially, it was introduced as a dwarf, but we find it is wide and spreading, reaching 3 to 4 feet in height.

'Armstrongii' is a sort of Pfitzer Juniper with a softer blue-green foliage, taking on the habit of Compact Pfitzer, rarely reaching over 3½ feet in height while being quite horizontal.

'Blaauw' is a semi-upright vase-shaped shrub with a rich blue-green foliage, reaching about 4 feet in height and width, making it an excellent hedge plant; formally or informally pruned.

'Fairview' is a narrow, pyramidal, vigorous growing plant with silver berry-like cones developing during late summer and early fall. This cultivar shows resistance to twig blight and mites.

'Hetzii' is a large, upright growing shrub, reaching 15 feet in height and width at maturity. Its foliage is dense, being lightly bluish-green.

'Iowa' is reported in some areas to have slight resistance to twig blight and is a somewhat upright growing shrub, reaching 10 feet in height. It is particularly effective in formal areas where that blue-green coarse foliage can add variety.

'Keteleeri' is a light to medium green foliage which is somewhat grayish-green early in the season, becoming a light green later. The habit of growth is broadly pyramidal with a good strong central leader. This plant is extremely effective in mass plantings or as informal hedges.

'Mint Julep' is an introduction of Monrovia Nursery. Its habit is somewhat upright, spreading with arching branches while not being nearly as horizontal as Pfitzer Juniper with a brilliant light green foliage. It is a uniquely shaped vigorous addition to the informal landscape.

'Mountbatten' is a 20-foot, dense, somewhat compact, narrow pyramidal-shaped tree. The foliage is a steel blue-green, reaching 18 to 20 feet in height.

'Pfitzeriana' is probably the most widely planted of the juniper types. Its broad spreading form, which reaches 5 to 6 feet in height and 10 feet in width, gives almost a fountain-like appearance. It is effective in mass plantings or as specimen shrubs. The light green foliage and habit are characteristic.

Mint Julep, a cultivar of Chinese Juniper (*J. chinensis*), spreads brilliant light green foliage.

'Pfitzeriana Compacta' is a dwarf or compact Pfitzer with gray-green foliage. It is slower growing and well suited to foundation planting. One must mulch late plantings heavily as winter injury can be a problem when planted in September and October.

Sargentii, a low-spreader juniper, 18 to 24 inches in height, with a 6 to 8-foot spread, is quite regular, giving a formal appearance to the area. It can be effective in mass plantings or as a ground cover with exciting blue-green foliage. Sargent Juniper shows excellent resistance to twig blight.

Procumbens (Japanese Garden Juniper), now listed as *J. chinensis procumbens*, is one of the premier juniper types. It reaches 12 to 28 inches in height with a 5 to 10-foot spread. Its light green foliage is exciting, allowing it to adapt well as a ground cover or specimen plant. It is extremely effective in beds or mass plantings, being contained easily with light pruning. In Michigan, *Phomopsis* (twig blight) rarely develops, but mites can become a problem.

Procumbens 'Nana' (Dwarf Japanese Garden Juniper) is very slow growing and considerably more compact. It may be used as a ground cover in rock gardens or in open areas. In Michigan and Ohio twig blight is an extreme problem. This plant has a place in the landscape, but it is so slow growing that any slight damage can often result in a plant that decreases in stature. It should be used sparingly in Michigan, but Dirr has reported few problems in Illinois. Again, check your local Cooperative Extension Service.

Common Juniper (*J. communis*) is native to a broad area of the United States. It should be noted though that provenance is important. Plants doing extremely well in New England will not always flourish in Pennsylvania. The habit of this small tree is somewhat ascending, reaching 6 to 12 feet in height. Wyman reported Common Juniper reaching 36 feet in the wild. The plant is sprawling with a fine needle-like foliage which is gray to blue-green in the summer, taking on a somewhat yellowish cast during the fall months. The cultivars of this group are well discussed in literature, but one should visit local nurserymen or the Cooperative Extension Service to obtain information as to local adaptation.

Creeping Juniper (*J. horizontalis*) is an exciting native ground cover plant. Although there are many varieties in this group which tolerate hot, dry, sunny locations, it is exciting when used in

rock gardens, foundation plantings, or mass plantings for erosion control. Many of the cultivars are extremely susceptible to twig blight; therefore, I shall only discuss the few which are showing good or almost complete resistance.

'Douglasii' is a very horizontal, rapid growing shrub. It reaches 12 to 18 inches in height and 6 to 8 feet in width. The blue-green foliage of summer often turns somewhat purplish throughout the winter months, adding additional color to the landscape.

'Emerald Spreader' is a low growing form, rarely over 6 to 8 inches in height with a light open habit. Its brilliant mint-green foliage is a great addition to the landscape, held year round.

'Wiltoni' or 'Blue Rug' is a very horizontal form, reaching 6 to 8 inches in height with a spread of 6 to 8 feet. Once established, this plant can grow quite rapidly.

Savin Juniper (*J. sabina*) and its cultivar are an exciting addition to the landscape. They range in height from 1 to 6 feet with a 5 to 10-foot spread. The species has dark green foliage in the summer, becoming a dull green during the winter months. It does extremely well on our high pH soils.

'Arcadia' has a similar habit of growth as var. *tamariscifolia* while being more prostrate, growing one foot in height and 3½ feet in width. The foliage is predominately grass green. 'Arcadia' shows good resistance to twig blight.

'Broadmoor,' a dwarf low-spreading shrub which tends to build up from the center with age, is unique in habit and color. The color, early in the season, is a brilliant mintgreen, becoming a soft gray-green during late summer, fall, and winter. 'Broadmoor' rarely goes over 18 inches in height while being five to 10 feet across.

'Von Ehron' is a vase-shaped shrub, 6 feet by 10 feet in the landscape, while reaching 15 feet by 45 feet, according to Wyman. The foliage is a light green. 'Von Ehron' has few problems while being extremely resistant to juniper twig blight.

Eastern Redcedar (*J. virginiana*), a native with an extensive range covering most of the area east of the Mississippi, thrives in well-drained, gravelly, high-water table soils but will tolerate almost any diverse soil condition. When young, it is fairly tolerant of shade but thrives in sunny, open areas. It is an excellent specimen or mass planting tree useful in hedges, windbreaks, or native planting. It reaches 40 to 50 feet with a 10 to 20-foot spread. Resistance to twig blight should be paramount in selection of cultivars. Some of the tree forms which show good twig blight resistance include 'Burkii,' 'Cupressifolia,' 'Glauca,' and 'Hillii.'

Junipers and Eastern Redcedar are extremely tolerant of many urban conditions. They thrive in droughty-gravelly soils needing little care if the correct plant is selected. That correct plant is one that will not outgrow its area or be attacked by mites or juniper twig blight. Juniper adds another dimension to our landscape with a narrow-leaf evergreen which thrives under severe winter or summer conditions. It is highly competitive and, therefore, should not be used around every tree, but only trees which are deep rooted and effective competitors, e.g., Bur Oak. **WTT**

Cut Overseeding Rates Up To
50% with a Great *Poa trivialis*

SABRE

There's no other turf grass quite like it.

The first U.S. variety of *Poa trivialis* granted a Plant Variety Protection Act Certificate, Sabre is a dark green, fine-bladed turf grass that creates an absolutely superb green when overseeded on dormant turf such as Bermuda.

A rapid germinating variety, Sabre is a perfect overseeding companion for the turf-type ryegrasses and fine fescues. In an overseeding mixture Sabre has the additional advantage of reducing the seeding rate by as much as 50%.

Normal overseeding rate for either the turf-type ryegrasses or fine fescues is 35-40 lbs. per 1,000 square feet.

However, the seeding rate of either a ryegrass or fine fescue overseeding mixture which includes 20% Sabre (by weight) can be reduced to 18 lbs. per 1,000 square feet.

An extremely shade tolerant grass, Sabre is an ideal component in an overseeding mixture because it will disappear very rapidly when the hot weather arrives, thus clearing the way for the emerging Bermuda grass to come on.

You can also count on Sabre to be free of *Poa annua*.

SABRE—add it to your overseeding mixture and you'll be amazed at the beauty you have created. (Sabre - P.V.P. No. 7700104)

Now Fiber Mulch

from

Con-Serv

*for
efficient
hydroseeding*

A low-cost, practical way to plant grass so it will stay and grow.

Con-Serv fiber mulch is a specially recycled material for hydroseeding, so grass can take root firmly in a weed-free environment. It's an instant anchor blanket which permits gradual, healthy absorption and retention of rain for maximum growing conditions without erosion.

Green Thermal Blanket

An attractive, water-soluble green blanket can be sprayed on in one application. It acts as a thermal barrier on the ground to foster germination, and then gradually decomposes as the grass naturally roots into the soil.

Phone or write for full information.

Con-Serv FIBER MULCH

A growing concern about grass.

At last...A fescue that's green enough to match bluegrass,

Jamestown Chewings Fescue

Researchers have long looked for a fine-leaved fescue that has the color and adaptability of modern bluegrasses and that will look well in a seed mixture. Jamestown, a low-growing new variety of chewings fescue, developed at the University of Rhode Island, is the answer for nearly every turf condition required. Jamestown has good disease resistance, shade tolerance, the darkest green color of any fescue on the market and wide adaptation. Jamestown has been thoroughly researched by universities and independent research groups throughout the United States and Canada. But, most importantly, the low growth and brilliant color are the outstanding virtues landscapers, contractors, sodmen and golf course superintendents count on. Jamestown can be used for practically any turf condition.

GENERAL LANDSCAPE...

For home lawn use, institutional, parks...university studies from Winnipeg, Canada to Maryland have consistently rated Jamestown number one in overall quality for the past five years. Jamestown broadens the adaptation of bluegrasses because of shade tolerance and lower fertility requirements.

SOD FARMS...

Jamestown is ideally compatible in persistence and color to the new Kentucky Bluegrasses such as Baron and Majestic. Its natural low and dense growth combined with its deep rich color makes Jamestown the number one fescue for use in the sod industry.

GOLF COURSES...

In the temperate climates Jamestown should be used for seed mixtures on tees, roughs and fairways. While in the Bermuda belt Jamestown is the best fine leaved fescue for fall overseeding greens. A Clemson University study showed that Jamestown is outstanding at a cutting height as low as 1/8 inch.

Remember... Jamestown is particularly useful where turf conditions are less than perfect. It does very well in non-irrigated and somewhat infertile soils where the turf may be subject to adverse conditions on low maintenance budgets.

Worldwide Producers and Marketing Agent

Lofts Pedigreed Seed, Inc.

Bound Brook, N.J. 08805 / (201) 356-8700

Showing a sample of Jamestown, is Dr. C. Richard Skogley, world renowned turf grass agronomist and researcher at the University of Rhode Island where Jamestown was developed.
