**THE NEXT
FRONTIER?**

About the only bug you have to worry about with DURSBAN.

So, if you've been having trouble controlling a certain squatty German bug with rubber legs, don't call us.

But, for just about any other bug problem, DURSBAN* insecticide is the answer.

It's labeled for all the major insects you'll be battling this year: chinch bugs, cutworms, armyworms, grubs, sod webworms, chiggers, clover mites, turfgrass weevil, earwigs and more.

No other insecticide fights them longer, either. While other brands quit after four or six weeks, DURSBAN keeps going strong up to eight weeks. And that could mean up to six fewer applications per year on year 'round courses.

But, even though it lasts longer, DURSBAN insecticide costs less than

**DURSBAN
is labeled
for all
the major
insects
and gives you
extra weeks
of
protection.**

most other brands. In fact, you can do a 1000 sq. ft. area for as little as 46¢. Which is probably why many courses are using DURSBAN on tees, fairways and around the clubhouse as well as on their greens.

DURSBAN is also gentle on desirable grasses, ornamentals and the environment.

Choose DURSBAN insecticide in 2E and concentrated 4E liquid formulations. Plus, 50W wettable powder.

DURSBAN. There's hardly a bug it won't get.

Available from your Dow distributor. Be sure to read and follow all label directions and precautions. DURSBAN...for whatever's bugging you. The Dow Chemical Company, 9001 Building, Midland, MI 48640.

Bug-free greens mean more accurate putting.

STOP GRUBS FROM THE FIRST BITE TO THE LAST GASP.

Grubs are a hardy breed. They're tough to prevent and even tougher to get rid of once they start chowing down on the roots of your turf.

One thing that puts them off their feed is *OFTANOL 5% Granular insecticide.

Another is new OFTANOL 2 Insecticide. It's a liquid formulation of OFTANOL, containing two pounds of active ingredient per gallon.

The nifty thing about OFTANOL, liquid or granular, is that it stops grub damage fast, even before it kills. After an application of OFTANOL, grubs stop feeding and the damage stops. Use it as a preventive, in the spring, or as a curative anytime grubs are a problem.

Grubs, one serious problem with two serious solutions. OFTANOL. Always read the label before use.

**OFTANOL.
WHEN YOU'RE SERIOUS
ABOUT GRUBS.**

TORQUE

POWER C

200

100

500

UNBEATABLE IN THE CURVES.

OUR NEW 12½ TWIN.

If a power curve is your measure of an engine, you don't have to look any further than the new Briggs & Stratton 12½ hp twin. It's unquestionably the super power of its size category.

When it comes to torque as well as smooth, quiet operation, it simply has no competition. In fact, there's really only one area of comparison. Price. You get all this extra at very little extra cost.

BIG POWER FOR TODAY'S BIGGER DEMANDS.

You get nearly 40% more displacement than with competitive engines.

It means greater torque and important back-up power. The kind you need for today's larger rotary blades, debris handling

systems and hydraulic drives.

It's the perfect engine for riding mowers, tractors and wide-area commercial mowing equipment.

A MORE COMFORTABLE RIDE.

A twin is naturally smoother running — the counter-acting forces of opposed pistons create less vibration. That means longer equipment life. And, of course, more comfort for your customers.

LONGER LASTING, QUIETER.

This I/C® (Industrial/Commercial) engine is loaded with long-life features. You get rugged cast iron bores. Cobalite® exhaust valves and seats. Valve rotators.

Replaceable DU bearings. A choice of super-quiet mufflers. A heavy-duty dual element air cleaner — so good it even exceeds automotive standards for efficiency.

And we top it off with a long-life warranty — our 2+5 extended warranty even covers commercial users.

The new Briggs & Stratton 12½ hp twin. All the power you need today. And then some. See your Briggs & Stratton representative for details.

BRIGGS & STRATTON

The power in power equipment.

by Bruce F. Shank, executive editor

Chemical lawn care exceeds mechanical for first time

Lawn Care Industry magazine has revealed gross revenues for chemical lawn care exceeded those for mowing/maintenance for the first time in the seven-year history of the magazine's State of the Industry Report.

The survey questionnaire, mailed to 1,500 lawn care companies, places 1984 chemical lawn care gross revenue at \$1.5 billion, compared to \$1.3 billion for mowing maintenance. Chemical lawn care grew at an amazing 40 percent pace while mowing/maintenance grew at only 11 percent, which isn't bad compared to most other service industries. Combined, the overall lawn care industry grew 26.6 percent in 1984.

The survey also revealed a large increase in tree care equipment purchases by lawn care companies as they expand into tree and shrub care. Increases in spray tank and irrigation supplies purchases indicates trends toward liquid application and irrigation installation.

Open shops grow in California

William Burke, executive director of the San Diego Association of General Contractors, told the California Landscape & Irrigation Council recently 'open shops' are causing unions to rethink demands. Open shops employ both union and nonunion tradesmen.

Burke's group is now developing medical and other benefit programs for open shops. Such programs further weaken union strongholds in California. Unions, after winning major wage and benefit increases in 1983, have had to accept concessions in following years. LA landscape contractors refused to grant union demands last year causing a strike.

Burke warned the group of Los Angeles area landscape contractors that open shops that pay excessively low wages will only strengthen unions.

Garden centers join discounters

Garden centers are fighting falling consumer pesticide sales by aligning themselves with discount chains. A recent survey by Charles Kline & Co. showed discount stores have captured the largest share of the \$1.4 billion consumer pesticide and fertilizer market, 31 percent compared to 23 percent for garden centers and 21 percent for supermarkets and grocery stores.

In certain markets, lawn and garden centers have entered into agreements with discounters such as Gold Circle to recapture shares of the market. Garden center chains, like Petitti Brothers in northern Ohio, connect their yards to discount stores. Consumers shopping at the discount store are attracted by the plant material displays. Consumers benefit from trained sales people and better quality plant material without having to make an extra trip to a remote nursery.

SURVEY

Women's landscaping role grows...slowly

Melissa Merritt's confidence in her groundskeeping abilities is solid. She's doubtful however, employers look at her in the same light.

When Dana Smithlin talks shop at a conference trade show she usually finds herself in the company of men. As a partner in Foothill Grounds, Tucson, AZ, she just doesn't find many other female business owners in the Green Industry.

Their story, if not typical, reflects some of the trends, often contradictory, uncovered by a recent survey by *Lawn Care Industry* magazine. A total of 2,000 questionnaires were mailed to lawn care and landscape companies.

Women are finding career opportunities in the landscape and lawn care industries the poll suggests, but the Green Industry is still male dominated. The acceptance of women workers (or more accurately the level of their involvement) has been steady. Steadily slow.

Of the 277 companies responding to the LCI survey, 168 (61 percent) "feel" landscape companies are hiring

more women. But of the 139 companies that added additional employees the last five years, only 64 (about 26 percent) added women to their payrolls. And only 20 percent of the women in the landscape and lawn care industries work "in the field" as opposed to the office.

"I didn't have any problems getting on a landscape crew in Texas," Merritt tells *WT&T*. But when she returned to her hometown to get a job on a stadium grounds crew, she was turned down flat. "I think they were afraid I couldn't do the heavy work." Instead, she applied for and beat out 62 other applicants for the top grounds job at Penn Valley Community College in Kansas City, MO.

Says Smithlin, "it was hard, really hard. Obviously, I have the support of my husband Peter and my brother Ed (the other equal partners in Foothill Grounds), but for the longest time I guess I was kind of like a silent partner."

Smithlin says clients often tried to bypass her involvement in the company. "They'd say, 'Nope, let me

speak to Peter.' That first couple of years I'd get very angry when this happened."

But with more than 40 employees, Smithlin let it be known she takes an active role in the company's affairs. "Someone has to make the decisions," she says. "Many of the men in this industry don't know how to run their businesses. There are a lot of successful companies—probably more than you realize—that have a woman running the books."

Smithlin, who started in the business with a shovel in her hand, says the impact of females in the industry will grow fastest as managers, landscape architects, or through the nursery ranks; not as laborers or crew supervisors.

The LCI poll suggests many employers shy away from hiring women field workers because of the heavy labor of moving railroad ties or swinging a 16 lb. sledge; a point Merritt isn't ready to concede.

"I can operate trucks and tractors," Merritt responds. "Lots of times I've
continued on page 66

TURFGRASS

Sports turf leaders set research committee

The decision to create a Sports Turf Research and Information Committee was unanimous after two days of information sharing by 14 sports turf figures from across the country.

"A great amount of good information on sports turf field management exists," Eliot Roberts of the Musser Foundation told the group. "We need to get it in the right hands." The Musser Foundation is a non-profit turf research foundation.

Dr. Henry Indyk, professor of soils and crops, Rutgers University, New Brunswick, NY, urged the group to stress the liability of poor sports fields to schools and parks. "No one seems to take poor fields seriously until some child gets injured," Indyk stated.

"A good sports field has a positive impact on a football, soccer, or baseball team," Tim Bowyer, president of Southern Turf Nurseries, Tifton, GA, said. "We install more than 100 new fields each year and team records improve in nearly every case. We know this, but reaching the right people to
continued on page 16

ASSOCIATIONS

PGMS, ALCA plan joint trade show

Two national associations are pooling their efforts for a trade show in Milwaukee late in 1986.

The Professional Grounds Management Society and the Landscape Management Division of the Associated Landscape Contractors of America will be holding a joint show in conjunction with their annual meetings Nov. 9-13 in the Milwaukee Convention Center. The show is planned for Nov. 11-12. A field day with demonstrations of equipment is set for Nov. 13.

RESEARCH

Growth regulator studied at Temple

A potential new low-cost growth regulator is being studied on tomato plants at Temple University by Dr. George Manaker, chairman of the university's department of horticulture.

"In the case of ornamental plants, we might see shorter production time, more flowers per plant, and earlier

flowering," Manaker says of the new compound which came to the attention of researchers about five years ago.

Although interest in the compound reportedly waned because of the expense of its production, scientists discovered that it is also found naturally in plants. For his research at Temple's Ambler Campus, Manaker is using an experimental compound which can be extracted from natural plant sources at much less cost than producing the pure chemical.

Manaker declines to name the compound to protect possible patent rights.

"We are now compiling data to see what the effects have been on growth and other plant development," the Temple researcher says.

INDUSTRY

Praise the Lord, pass the shovel

Landscapers in sunny Southern California chalked up some points on that big board in the sky recently.

Members of the Long Beach/Orange County Chapter of the Cal-

ifornia Landscape Contractors Association (CLCA) donated time and material to help a church prepare its sanctuary for Easter.

"They came in here and did the whole thing from the turf to the trees," Dan Moore, pastor of the Living Waters Christian Fellowship in Fountain Valley, tells WEEDS TREES & TURF. "They did an incredible job. For four or five days they had 15 or 20 fellows working on our property. They seemed to be having a ball."

Moore reports the cooperative landscaping effort transformed the two-acre church grounds into a garden. He terms the effort of the landscapers and their suppliers as "a humanitarian gesture."

For their part, the CLCA members felt the project was a pretty fair image builder. Or as Gary Walters, president of the local CLCA chapter, says: "We want the community to know that the members of the CLCA are not out to make a quick buck."

Mike Cucchiara of Hydro-Scape Products arranged for the donated materials and time, while Wayne DuBoise of Mission Landscape in Mission Viejo coordinated the actual construction.

Save Time, Money

Remove traffic lines fast

Get TENNANT® TLR: one person can remove 4 to 10 ft. of markings per minute, permanently and without surface damage. Works 6 times faster and at 1/4 the cost of other methods. Scraping tool revolves at 1500 rpm, erases lines up to 10" wide in a single pass. Easy to use; self-propelled. Works on concrete or asphalt. Powerful 9 hp engine.

Turn your pickup into a sweeper

Convert 3/4 ton pickup into air-sweeper in 5 minutes: detach easily, too. TENNANT® 717 cleans 76" path, up to 15 mph. Sweeps right up to curbs, backs into tight spots, dead ends. Sweeps backward or forward; loads into 2 cu. yd. hopper. 36 hp liquid cooled engine. 2-yr./1500 hr. warranty. Lease/time-purchase/rental plans.

Circle No. 140 on Reader Inquiry Card

You just started construction on another 18 holes. The last thing you need is armyworms.

Thank goodness they don't show up every year. But when they do, most superintendents choose SEVIN® brand SL carbaryl insecticide.

But SEVIN® brand SL is more than the top-of-mind choice for armyworms.

The fact is, no other insecticide controls more turf pests. So with SEVIN® brand SL carbaryl insecticide on hand, you're prepared to handle just about anything.

Without clogged nozzles or tank-mix problems. Without corroding equipment. And without protective gloves or masks.

As a water-based flowable formulation, SEVIN® brand SL is easy to handle, mix and apply. So with the time available for application, you spend more time spraying. Less time re-filling.

Tried, tested, trusted

SEVIN® brand SL carbaryl liquid effectively controls over 25 common turf insects, including sod webworms, white grubs, billbugs, chinch bugs, even ants, ticks and fleas.

SEVIN® brand carbaryl kills insects on contact as well as by ingestion. So you get

extended residual action whether pests are feeding or not.

And SEVIN® brand carbaryl insecticide gives you the peace of mind that comes from knowing it's used for insect control on pets, poultry and even some game birds.

So it's ideal for insect control in golf courses, parks, and other recreational turf areas used by people.

In fact, you can put greens, fairways and other golf course areas treated with SEVIN® brand SL back into play as soon as the spray is dry. You keep more turf area in use. And to the people who play your course, that's important.

Dependable SEVIN® brand

SEVIN® brand carbaryl is biodegradable in the environment. And there's no harsh odor to annoy players.

SEVIN® brand carbaryl insecticide is registered not just for turf but also trees, shrubs, and flowers. So you don't need to keep track of a large number of different insecticides.

Ask your turf chemicals dealer for SEVIN® brand SL carbaryl. As with any insecticide, always read and follow label instructions.

From the turf care group at Union Carbide

UPDATE

Herbicide defense workshop held

More than 60 people in forestry, lawn care, and agriculture met in Atlanta this spring to learn about defending pesticides on the state and local level. The workshop was sponsored by the National Coalition for a Reasonable 2,4-D Policy and featured Edith Efron, author of the book *The Apocalyptics* on cancer research in the U.S. Efron contends that public opinion about cancer has been shaped through the media by false information about man-made versus naturally occurring carcinogens.

Harold Olinger, assistant chief of administration for the Virginia Division of Forestry, outlined the types of public hearings and told the workshop attendees how to use them to their advantage. "The public hearing can serve many purposes and we need to learn to use it to our advantage," Olinger advised.

Mary Ann Ford, public affairs manager for Union Carbide, told the group public relations programs are necessary to encourage a better two-way understanding.

Labor lawyer Richard Lehr told the group employees must be aware of customer concerns since liability begins with employees.

Ray Russell, public affairs manager for the Dow Chemical Co., Agricultural Products Dept., said pesticide disputes are more common today on the state and local level. Specific products are being challenged rather than pesticides in general said Russell.

Agency, legislature disagree

Members of the Texas House Agriculture Committee believe that state's Department of Agriculture overstepped its bounds when it issued regulations recently requiring farmers to pre-notify neighbors and delay farmworker entry to treated fields. The Department's regulations were harolded by the Environmental Protection Agency as bold measures to protect neighbors and farmworkers from pesticides. The state's pesticide lobby didn't think it was within the Department's authority to set such restrictions.

Minnesota faces fertilizer limits

Local ordinances in Minnesota intended to limit the amount of phosphate reaching lakes may include limitations on fertilizers applied to turf to 0.5 lbs. phosphorus per 1,000 sq. ft. per year. The Minnesota Agricultural Fertilizer Dealers Association is researching legislation in other states regarding fertilizer applications. Both current consumer and professional fertilizers would exceed this amount of phosphorus. Lawn care companies and golf courses would have to limit phosphorus applications to once per year if the ordinances take effect. Persons with experience in similar fertilizer legislation are urged to contact Craig Sallstrom, 1821 University Ave., Room 253, St. Paul, MN 55104.

"I've been in the CLCA for some time now and this isn't the first time we've joined together in a community project," Walters adds.

The California Landscape Contractors Association donated time and material this spring in helping the Living Waters Christian Fellowship in Fountain Valley get its sanctuary ready for Easter. Shown here (l to r): Pastor Dan Moore, Mike Cucchiara, Wayne DuBoise, Dave Patterson, Bob Cavanaugh, and Gary Walters.

INDUSTRY

Herbicide Team gets grass registration

Team, a herbicide from Elanco, has received registration for control of crabgrass, goosegrass, and other weed grasses in cool-season turf. It should be available in limited quantities in 1985.

Golf course superintendents will be evaluating claims it provides long-lasting and improved control of late-germinating annual grasses.

ASSOCIATIONS

Georgia golf groups sharing quarters

Headquarters of four separate golf-related organizations in Georgia are going to be located under the same roof. Each association, however, will retain its autonomy.

"This is in no way a merger between any of the associations," says Wendell Couch, president of the Georgia State Golf Association (GSGA).

Joining the GSGA and the South-eastern Region of the U.S. Golf Association in their office in Marietta, GA, are staff members from the Georgia Golf Course Superintendent's Association (GGCSA) and the Georgia Section of the Professional Golfers' Association of America.

AWARDS

Wisconsin architect honored for project

Judson E. Griggs transformed a section of an industrial park into a scenic setting for videotape commercials. He

received the Environmental Improvement Grand Award from the Associated Landscape Contractors of America (ALCA) for his efforts.

"It's rewarding to be recognized professionally by your peers," says Griggs, a landscape architect with Lied's in Sussex, WI.

"More importantly, I'm happy that we were able to meet the needs of our client." The client in this case was Marx, Inc., a motion picture studio in Glendale, WI.

Keys to beautifying the industrial

park and making it suitable for the filming of outdoor television commercials were the use of mature plants and improvements to the area's drainage, including the addition of a small pond. Griggs' design encompassed electrical work, bridge construction, lighting design, and pedestrian and vehicular circulation.

Explains Griggs, "with careful placement of mature plants, naturally sculpted earth beams and the construction of several outdoor structures, the industrial park atmosphere was eliminated."

Judson E. Griggs

COMMITTEE from page 8

tell it to has been extremely difficult," Bowyer pointed out.

Dr. William Daniel, professor emeritus, agronomy, from Purdue University, West Lafayette, IN, told the group the primary insurer of sports fields in the U.S. increases premiums by 50 percent if a team plays more than half its games on artificial turf. John Macik, sports medicine coordinator for the National Football League, said professional football players favor natural turf over artificial for career longevity and severe injury reasons.

After revealing the large volume of existing support information for sports field construction and maintenance, the group decided to create a Sports Turf Research and Information Committee, under the Musser Foundation umbrella. Dr. Fred V. Grau will serve as information coordinator to help parks, schools, and other sports sponsors improve their fields. Data on the size of the sports field market is also being gathered for the benefit of manufacturers and suppliers interested in the push for better sports turf.

For more information, contact Dr. Fred V. Grau, P.O. Box AA, College Park, MD 20740. (301) 864-0090.

IN-THE-MIDDLE

by Bruce F. Shank, executive editor

Lebanon stands behind golf distributors

In the April issue of *WT&T*, we reported on Lebanon Chemical Corp.'s creation of a new division to sell to lawn care companies. The reason for the new sales emphasis was prompted by the price sensitivity and highly competitive nature of the lawn care market.

In the same article, we mentioned Randy Rogers, who is in charge of program development for the Country Club and Greenskeeper lines sold by Lebanon. Some golf superintendents took this to mean they could buy direct from Lebanon and the company's distributors were quite upset.

This is not the case. The Lebanon distributor provides an important service and inventory function to the golf superintendent. If superintendents started buying direct from the manufacturer, an important service to the golf industry would be harmed.

Chemical distributors extend too much credit to customers

A recent study of pesticide formulators and distributors by Velsicol Chemical Co. credit manager Karen Miller has raised some concern about current credit policies in the industry.

Miller told the members of the United Pesticide Formulators and Distributors Association during a recent meeting in Phoenix their margins are too thin and, in some cases, their debt too high. "I see small distributors disappearing because they are undercapitalized," Miller said.

Miller showed the group what accounting ratios should be and what a survey of the UPF&DA revealed they really are. Gross margins, which should be 40-50%, are actually 18-24%. Current assets to current debt ratio, which should be 3 to 1, is actually 1.7 to 1 for distributors under \$10 million gross and 1.3 to 1 for those over \$10 million. Net profit, which should be 10-15% of tangible net worth, in this survey is actually an 8% loss for distributors under \$10 million and 9% return for those over \$10 million.

Miller said that in some cases manufacturers have been overselling distributors, putting the distributors in the highly-leveraged positions they are in today. She also strongly urged distributors to institute tougher collection policies saying collection periods are stretching to 75 days from the 30 days they should be.

Lofts also supplies Host chain

In the April column we reported that Adikes stood to benefit from its relationship with Flowertime, recently purchased by General Host. Host is reportedly planning to establish a national chain of garden centers.

Jon Loft, chairman and president of Lofts Seed Inc., pointed out Adikes is not the only company supplying seed to Host. His company has also been supplying seed to Flowertime and Frank's Nursery, another Host garden center chain, for 17 years.

PEOPLE

Names in the news

James Taylor, head of Taylor Tree Surgery, Walden, NY, takes the reins as president of the New York State Pesticide Users Council (NYSPUC). He was elected during the first annual meeting of the NYSPUC in Albany. About 65 industry people attended.

Others elected at the meeting of the year-old group include: Vice President **Dr. James Dewey**, Secretary **Robert J. Mungari**, and Treasurer **Fredrick Boyd**.

The National Landscape Association (NLA) recently tabbed **Robert Siebenthaler**, Dayton, OH, as president. **Denny R. Church**, Lombard, IL, is the new vice president; **William K. Doerler**, Lawrenceville, NY, secretary-treasurer.

This spring also saw **George Koziarz** returning to the post of president of the Illinois Landscape Contractors Association—his second term. He will be aided by Executive Vice President **John Hendricksen**, Vice President **Ken Gallt**, Treasurer **Jim Bussey**, Secretary **Bill Davids**, and Sargeant-at-Arms **Pete Grathoff**.

Gary D. Myers, president of The Fertilizer Institute, announces the appointment of **Pamela W. Lucas** as assistant vice president. Lucas joined the Institute in November 1982.

Longtime landscape industry spokesman **Karl Korstad** was surprised with an honorary membership for life in the Associated Landscape Contractors of America (ALCA) this past winter. Korstad, ALCA publication chairman, and his wife, Frances, have been in the landscape business for 35 years.

LANDSCAPE LOG

by the Editorial Advisory Board, *Weeds Trees & Turf* magazine

July presents turf disease challenge

Southwest and Southeast landscape managers should be on the look out for turf disease symptoms beginning in July. Kent Kurtz at Cal Poly Pomona suggests aerification, light verticutting, and fertilization of bermudagrasses in July. Diseases may crop up late in the month with summer rains.

Bruce Augustin of the University of Florida says brown patch on St. Augustine and leafspots on bermudagrass develop in Florida in July. Webworms, cutworms, and chinchbugs are also in high gear during the month. Augustin recommends curative rather than preventative insecticide treatments due to problems with resistance.

In the Great Plains, conditions are drier says Robert Shearman of the University of Nebraska. Irrigation should be utilized to avoid drought stress and fertilizer should be withheld from cool-season grasses. Summer patch, brown patch, and pythium are potential threats in July.

Armyworms, bluegrass billbug larvae, white grubs, and greenbug aphids are active at this time. Spider mites may be damaging ornamentals. Elm leaf beetles, peach tree borers, and pine needle scale are also active.

Roses should be sprayed at regular intervals for

blackspot control. Junipers should be sprayed with copper fungicides for cercospora twig blight.

Midwest and Northeast landscape managers are also on guard for signs of drought stress says Martin Petrovic of Cornell. Trees and shrubs can be mulched to keep root zones moist and cool.

July is the right time to trim or shear evergreens says Petrovic. Watch for mite infestations.

Harry Niemczyk of the Ohio Agricultural Research and Development Center, urges golf course superintendents to check for damage by *Ataenius spretulus*. Cutworms, grubs, chinchbugs, billbug larvae, greenbug aphid, and sod webworm are also insect concerns in July.

Mid-Atlantic landscape managers should aerify, verticut, irrigate, and fertilize warm season grasses says VPI & SU's Jack Hall. Postemergence weed control and treatment for dollar spot are appropriate in July. Warm season turf repair is recommended.

Hall says cool-season turf may need to be limed and treated for emerged weeds. Sod webworms, chinchbugs, and billbugs can be problems. Brown patch, dollar spot, Fusarium, and pythium diseases may attack in July.

NOR-AM CHEMICAL COMPANY

WHAT MAKES THE CUSHMAN TURF-CARE SYSTEM WORTH THE INVESTMENT:

Aerating, hauling, dumping, spraying, seeding, spreading and top dressing — one vehicle does the work of a fleet of machines.

The Cushman Turf-Care System offers you a single vehicle that can do the work of a half dozen machines—at a fraction of the cost.

The exclusive Cushman pin disconnect system lets you attach and remove accessories in minutes.

A NEW 22-HP ENGINE.

The Cushman Turf-Truckster™ is now equipped with a new 22-hp gas engine.

It gives you the power to haul a full load uphill, without straining. It maintains a sure, steady speed while you're spraying or spreading.

And it's built tough. The crankshaft is forged alloy steel. The cylinder heads are reinforced for extra strength under stress. And the hydraulic pump is mounted to the engine for better service life and smooth operation.

Team up the new 22-hp Turf-Truckster with any of the following accessories for a complete Turf-Care System.

THE AERATORS.

Because you have two types of turf to aerate, Cushman makes two aerator attachments for your Turf-Truckster.

The Greensaver® is ideal for greens and other delicate areas . . . while the Quick Aerator makes short work of big jobs (it covers a 46" swath).

Both can be equipped with interchangeable coring or deep-slicing tines.

THE DUMP BOXES.

Again, you have a choice! Our Short Box is a high quality dump box . . . and our Flatbed/Box converts from flatbed carrier to dump box just by adding the bolt-on sides and tailgate. Both can be hydraulically dumped right from the driver's seat.

THE SPRAYERS.

Choose the capacity you need . . . our big 150-gallon sprayer or 100-gallon model. Both give you uniform spraying controlled by the Turf-Truckster's ground speed governor.

THE SPREADERS.

Two choices here, too. The 700-lb. capacity Vicon Spreader with a 45' swath. Or the Spreader/Seeder with a 300-lb. capacity. Both give you smooth, uniform spreading because application rates are controlled by the Turf-Truckster's ground speed governor.

THE TOP DRESSER.

Everything from rock salt to powdered fertilizer can be uniformly spread across a 31½" swath at a rate of up to 220' per minute.

Thatch is a layer of living and dead tissue located between the green vegetation and the soil surface.

Power raking combined with core cultivation was the preferred method of reducing excessive thatch accumulation in a study at the University of Nebraska.

Thatch Management

Knowing when thatch is beneficial and when it's troublesome can save otherwise doomed turf areas.

Thatch is a management consideration on most turfgrass sites.

It is a tightly interwoven layer of living and dead tissue existing between the green vegetation and soil surface. Its chemical composition is comprised primarily of lignin, cellulose and hemicellulose.

(This story was authored by Dr. Bruce Augustin, University of Florida; Dr. J.R. Hall III, Virginia Polytechnic Institute and State University; Dr. A. Martin Petrovic, Cornell University; and Dr. Robert Shearman, University of Nebraska. All are members of the WT&T Editorial Advisory Board.)

Often in older turf areas, one can observe two distinct layers in the thatch. There is a loose thatch top layer composed of growing lateral shoots and recently decaying matter. Beneath this layer is a dense bottom mat of peat-like material that is difficult to decompose.

The causes for thatch accumulation are numerous and all are not clearly understood.

However, it is reasonable to assume that thatch accumulates when organic matter production increases; it is difficult for the microbes involved in decomposition to keep pace. The

net result is thatch accumulation that must be handled by the turfgrass manager.

Benefits

Small amounts of thatch can actually be beneficial.

A one-quarter inch layer of thatch can be useful in reducing moisture evaporation from the soil, insulating the crowns of grass tissue from extremes of cold and hot temperature, reducing annual weed seed germination, protecting the crown tissue from traffic damage and otherwise improving the turf.

Researchers generally agree that thatch should not be allowed to accumulate to levels in excess of 0.5 to 0.75 inch on lawns, sports or general turf sites. This level should be a quarter inch or less on golf greens. Accumulations greater than these generally result in thatch disadvantages outweighing any potential advantages (See Table 1).

Accumulation rates

Turfgrass species and cultivars differ in their thatch accumulation rates.

Research at the University of Nebraska has demonstrated that vigorous,

Small amounts of thatch can actually be beneficial.

actively-growing Kentucky bluegrasses with high lignin content are more prone to thatching than less vigorous ones (See Table 2).

This relationship is very important, since in most cases vigorous well-adapted turfgrass species and cultivars are preferred.

Thus, these vigorous, well-adapted species and cultivars will require more careful management to minimize the rate of thatch build-up.

Thatching tendency increases with mowing height. Kentucky bluegrass turfs mowed at two inches had twice the thatch accumulation of those mowed at one inch after four years of maintenance.

In a similar study, thatch accumulation at three inch mowing height was 67 percent greater than that at two inches. This relationship coincides with the fact that higher mowing heights produce vegetation with greater lignin, cellulose and hemicellulose contents, which are the primary chemical constituents of thatch.

Nitrogen fertilization has often been associated with increased thatch. However, research at Nebraska with Kentucky bluegrasses and creeping bentgrasses showed no difference in thatching tendency for nitrogen rates ranging from 0 to nine pounds N/1000 sq. ft.

Under these study conditions the organic matter decomposition was sufficient to keep pace with the organic matter production and thatch did not accumulate.

A Kentucky Bluegrass turf with 1.5 inch thatch accumulation was studied at the University of Nebraska turfgrass research facility. Power raking in combination with core cultivation practiced in the spring and fall

TABLE 1

Advantages and Disadvantages of Thatch in a Turfgrass Community

ADVANTAGES (When present in moderate amounts):

- Insulates the soil surface beneath the thatch layer
- Reduces soil compaction
- Increases the resiliency or cushioning effect of the turf
- Increases turfgrass wear tolerance*

DISADVANTAGES (When present in excessive amounts):

- Increases turfgrass environmental stress
- Reduces turfgrass to heat, cold, and drought
- Increases disease incidence
- Increases insect activity
- Increases puffiness, scalping, foot-printing, and spiking
- Increases proneness to localized dry spots
- Increases susceptibility to iron chlorosis
- Reduces activity of certain pesticides
- Increases phytotoxicity of certain pesticides

*Research at the University of Nebraska indicates that wear tolerance increases with thatch accumulation until a critical point is reached, when wear tolerance decreases.

From: Thatch Symposium, Weeds/Trees/Turf, April 1979.

* Based on relative levels (i.e. high, medium, and low of thatching).

was the most effective means of reducing the accumulated thatch when compared to power raking or core cultivation alone.

Core cultivation reduced thatch and increased bulk density when compared to the untreated thatchy turf.

In a golf green study core cultiva-

tion in combination with vertical mowing and light, frequent topdressing was most effective in minimizing thatch build-up.

Auburn University has examined thatch buildup on bermudagrass, looking specifically at nitrogen source, core aeration, vertical mowing and sand topdressing.

Researchers there noted that after three seasons of observation, 12 pounds N/1000 sq. ft./year of activated sewage sludge fertilizer produced significantly more thatch (17 percent) than 12 pounds N/1000 sq. ft./year from ammonium nitrate.

In this study, where aeration cores were collected, no significant decrease in thatch buildup was brought about by increasing the frequency of core aeration from two times per year to five times per year.

Vertical mowing lightly 12 times per year produced no less thatch than two light vertical mowings.

Topdressing once per year produced 37 percent more thatch than a four topdressing per year program that applied 2.5 times as much topdressing.

The experiment was conducted under golf green maintenance conditions and mowed at 1/4 inch mowing height¹.

University of Illinois research on Kentucky bluegrass thatch buildup as it is affected by mulching mowers and nitrogen level suggests slightly higher thatch buildup resulted from higher nitrogen levels, with six pounds N/1000 sq. ft./year.

Turf quality comparisons indicated that on most rates turf quality was superior when clippings were returned. This effect was less noticeable at the six pound rate than at the lower rates.

Greater thatch buildup was noted in plots mowed once every two weeks than in those mowed more frequently.

Over the three growing seasons, the plots mowed once per week with a mulching mower produced 26 percent less thatch build up than the plots mowed once per week with a conventional rotary mower returning clippings. Removing clippings in this study did not significantly reduce thatch buildup².

Other work at the University of Illinois has illustrated thatchy Kentucky bluegrass turf will degrade diazinon more rapidly than turfs with no thatch, given equal irrigation management. Three weeks after diazinon application to turf with a one-inch thatch layer receiving daily irrigation, only seven percent of the applied diazinon remained. The same turf irrigated every four days retained 33 percent diazinon after three weeks³.

Turf without thatch, irrigated every four days, retained 47 percent of the applied diazinon after three weeks.

In the Northeast

There are six major problems associated with thatch on cool season

turfgrass found in the Northeast.

First, when an excessive thatch layer exists (greater than one inch), the turfgrass stand is less tolerant of stress conditions. This is primarily due to the greater temperature extremes found in thatch as compared to soil, and to the fact that most of the turfgrass root system is contained in this zone of greater temperature fluctuation (higher and lower temperatures than soil).

Second, thatchy turf uses water less efficiently than non-thatchy turf. Again, this is due to a concentration of

... once a site is heavily thatched, the only effective method is to completely remove the old sod and reestablish the site.

the root system in a more porous, less water-holding medium than soil. Thatchy sites can have poor water penetrability (hydrophobic) once the thatch has become dried, allowing for the waste of either irrigation or rainfall.

Third, thatch provides the medium for insects and diseases to live and thrive in.

Certain fungi live on dead and/or dying organic matter in the thatch most of the time. However, when the environmental conditions favor the fungi, it can spread rapidly and attack healthy turf. Some surface feeding insects can live during the growing season or overwinter in the thatch zone.

Fourth, thatch can alter the effectiveness of pesticides and/or increase the chance of phytotoxicity from the pesticide. Many of the insecticides used for grub control are readily bound or tied up by the thatch and do not easily reach the soil to kill the grubs.

Herbicides, like preemergence crabgrass materials, can cause considerably more damage to turf on heavily thatched sites since the root system of the turf is in greater contact with the herbicides.

Fifth, it is extremely costly to renovate or reestablish a heavily thatched site. This is further complicated since on many areas (lawns, parks, etc.) mechanical methods of dethatching are used to remove thatch.

Cornell University found that only 5 percent or less of the thatch is re-

moved by dethatcher. This suggests that once a site is heavily thatched, the only effective method is to completely remove the old sod and reestablish the site.

Sixth, applied nitrogen is less likely to be used by the plant on thatchy sites than non-thatchy turf. This is especially true for water soluble nitrogen sources for which it has been shown that a high percentage of the nitrogen can be lost back to the atmosphere. Research on thatch in the Northeast is primarily limited to the University of Maryland and to Cornell University.

Dr. Peter Dernoeden, University of Maryland, is conducting research on the effects of composted sewage sludge on thatch development.

Dr. Jack Murray of the USDA observed that less thatch occurred on plots treated with composted sewage sludge than on plots treated with other nitrogen sources.

In Florida

Thatch management is an important part of turf culture in Florida. It is a subject homeowners and condominium dwellers recognize, but know very little about. It is usually left up to the professional turf manager to deal with the causes of thatch build-up, cultural problems caused by thatch and ultimately, its removal.

The thickness of thatch in warm season grasses is generally greater than in cool season grasses because of vigorous stoloniferous growth and the coarse texture. It is not uncommon to find a St. Augustinegrass lawn where you literally sink up to your ankles in six inches of thatch, composed of layer upon layer of stolons.

Almost no thatch layers are to be found in some very old bahiagrass, centipedegrass and St. Augustinegrass lawns where there have been minimal turf maintenance practices over the years.

In these lawns, the decomposition of debris is at a rate equal to or greater than the rate of turf production. High temperatures for long periods of the year and fluctuating moisture conditions cause rapid oxidation of organic matter by bacterial and fungal organisms in Florida. A similar situation exists in the drained organic soils of the Everglades agricultural areas which are subsidizing (oxidizing) at the rate of one inch per year. So one can use the environment, to some extent, to help control thatch in Florida.

Many questionable practices are performed on Florida turf areas in the name of thatch control.

Scalping is often done in the early spring. While it may remove some of

THE TENSION RELIEVER.

You can worry about turf problems caused by too much or too little water, or you can use AQUA-GRO, the water

AQUA-GRO[®] management tool. AQUA-GRO is a blend of non-ionic organic wetting agents, 100% active ingredient with residual effectiveness in all soils.

AQUA-GRO ELIMINATES LOCALIZED DRY SPOTS ...AND COMPACTION.

AQUA-GRO is the specially formulated wetting agent that reduces water surface tension ensuring faster, more uniform

penetration and drainage, through hard-to-wet soils and thatch.

AQUA-GRO also relieves compaction by improving water penetration, drainage and aeration in high traffic areas. There's less need to aerify, or resort to costly rebuilding.

AQUA-GRO INCREASES FERTILIZER AND PESTICIDE ACTIVITY.

You get more from your turf chemical investment with AQUA-GRO. Turf chemicals are uniformly distributed throughout AQUA-GRO treated soils, so chemicals are used by plants more efficiently. And

AQUA-GRO helps turf chemicals penetrate thatch.

AQUA-GRO REDUCES WATERING COSTS 30-50%.

AQUA-GRO reduces irrigation costs, because water is used more efficiently. There's less run-off and less evaporation... you use less water, plants get more. AQUA-GRO helps you get your turf through the hottest weather. And AQUA-GRO lasts, because it won't leach.

Let AQUA-GRO relieve your tension. Available in liquid concentrate or spreadable granular formulations from your AQUA-GRO distributor.

Circle No. 101 on Reader Inquiry Card

the upper stolons and decrease the sponginess, scalping does not remove the majority of the thatch layer.

This practice can harm turf quality if the turf is not nursed back to health. Power raking is frequently used in some areas. It can remove some of the loose upper thatch layer debris, but is not effective in removing the denser mat layer. It is not a substitute for vertical mowing.

Another of the practices found in Florida is "sanding." This is a very heavy topdressing (sometimes up to several inches) applied to turf. Of course, this practice creates thick layers in the soil and all kinds of problems.

We see many of the cultural practices used on golf courses applied to other urban turf areas. These practices might be appropriate on a golf course where they are used on a regular and proper basis. But on other turf areas, it is questionable how effective these practices can be if they are being done only sporadically by someone who does not understand the consequences.

The future

An extensive project is being initiated at Cornell University under Dr. Mar-

tin Petrovic and Ph.D. candidate Robert Vavrek, Jr.

This project will involve studying several factors involved with thatch development, including the interactive effects of nitrogen, phosphorus, potassium and water on thatch development. This research will be conducted in a new facility being completed this summer which carefully controls and monitors water applied, and excludes rainfall by a rain-activated moveable greenhouse called a rainout shelter.

This tenth-acre site will provide useful information on predicting thatch accumulation as related to fertility and water.

Vavrek will also study the effects of microarthropods (mites, etc.) on the thatch development process. Some researchers believe that these insects have little effect on organic matter breakdown (i.e. thatch breakdown), but it has been found that the levels of these types of insects are very high in the turfgrass ecosystem.

Control tips

University research is bringing us closer to a better understanding of how cultural practices affect thatch buildup. From a practical standpoint,

the following tips will be helpful in controlling thatch buildup:

- Utilize moderate levels of nitrogen fertilization and proper mowing frequency.
- Utilize pesticides that interfere least with micro and macro-organism activity.
- Maintain the pH in the thatch layer at a level conducive to microbial activity 6.0 to 6.5.
- Maintain a favorable organic matter decomposition environment through core aeration, topdressing and maintaining favorable carbon to nitrogen ratios (25-30 to 1) in thatch.
- Choose cultivars and species that have lower thatching potential whenever possible.

SAVING MONEY ON PUMPING WATER HAS NEVER LOOKED SO GOOD.

How pumps powered with Franklin submersible motors can make your corner of the world green and quiet. And save you money, too.

Saving time saves you dollars. A submersible pump powered by a Franklin motor can be installed in one-third the time it takes for an above-ground line-shaft turbine.

And with a submersible pump, you won't have line shaft vibration and alignment problems, or any need for lubrication cost and troublesome ratchets.

A submersible eliminates expensive, energy-gobbling friction losses in a long drive shaft and multiple bearings.

Yet submersibles do more than save you dollars. Working quietly underground, a submersible keeps your view beautifully quiet. Built to run underwater, a submersible can't be flood-damaged. And submersibles are virtually vandal and varmint-proof.

To learn more about the advantages of submersible pumps equipped with Franklin motors, call Franklin Electric's Jim Hayes today at (219) 824-2900. Or write Franklin Electric Company, 400 East Spring Street, Bluffton, Indiana 46714.

Submersible pumps and Franklin motors economically keep your grounds lush, green and quiet.

Franklin Electric

Water for a Thirsty World

In mid-March athletic fields in the northern United States show the scars of battles won and lost the previous fall.

Meanwhile, spring sports teams are already practicing and softball teams are organizing for their summer leagues. The damaged turf must somehow be readied to provide a playable surface for upcoming sports events.

The practice of overseeding is often the only means of providing a turfgrass cover on athletic fields from year to year. There are also times when a home lawn or other turfgrass areas succumb to disease, insects, chemical damage or environmental stress. Here, too, overseeding offers a practical

Hummel is on the extension faculty, turfgrass management, Cornell University).

means of repairing the damage and improving the overall quality of the turf.

Overseeding is a partial renovation process used to improve damaged turfgrass areas. Overseeding becomes necessary when the turf is damaged to an extent that it cannot recover with standard maintenance practices, such as fertilization. It is a selective tillage process that falls short of completely reestablishing the entire area. Overseeding can also be used as a means of introducing more desirable grass species or cultivars into an existing sod.

Timing

One of the more difficult places on which to maintain turf is an athletic field. The intense wear that athletic fields are subjected to make annual overseeding necessary to maintain turfgrass quality and playability.

Early fall would be the optimum time to overseed an athletic field because the warm days, cool nights, and adequate precipitation are conducive to rapid establishment of cool season grasses.

However, it is usually necessary to have the field in playable condition much sooner in the year. A more realistic time to overseed is mid to late spring. Dormant seeding in early winter should be avoided because seed germination could be greatly reduced by seed rot.

Honeycomb seeding is a method of overseeding that many old-timers and some not-so-old-timers swear by.

Honeycomb seeding should be performed in mid-February to late March in the northern United States. Seed should be divided into three or four

continued on page 34

Overseeding has proven itself a valuable "pinch-hitter" in healing athletic field scars and in producing high quality turf.

A Practical Quick-Fix

by Dr. Norman Hummel, Cornell University

A flexible-tine harrow is an effective method of preparing a site for overseeding.

Control, and results, you can see!

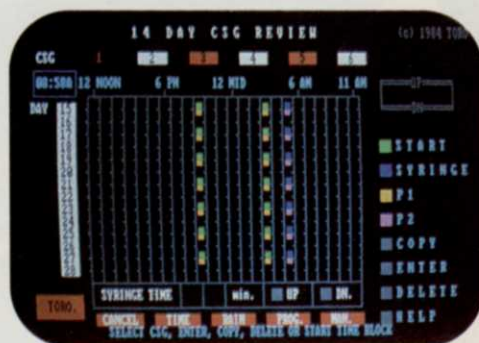

When Toro introduced the first VT3™ Video Central Irrigation Controller last Summer, it offered you a whole new world of flexible control and simplicity. We call it "pen-point" control; users call it a godsend. But we didn't stop there. In response to your needs and your requests, we've continued to add new features, enhanced capabilities. Now, there are three different models to choose from, plus three options to make them even more effective. One is a flow screen, with a moving graph showing *real* flow (not calculated), so you'll know if your pumps are performing efficiently. A second option is our new Rain-Guard, which automatically cancels your program on a rainy night; you don't have to be there! Third is a remote control capability, enabling you to operate or monitor your system from one PC to another; for example, from your home, to avoid an emergency trip to the course. Now isn't that the kind of control *you* should have? You'll get it only from Toro. But don't just take our word for it; you must see VT3 Video to believe it. Call *The Man from Toro* today, let him give you a full demonstration, at no cost or obligation.

TYPICAL SCREEN DISPLAYS

Excellence in Irrigation®

**If you're not using Daconil 2787[®]
on your golf course,
you don't have many alternatives.**

Sure you've used other fungicides. Even tried one or two of the new systemics. But they didn't measure up to diseases like dollar spot and brown patch. Tees, greens and fairways had a lot of problems. And you had a lot of headaches.

Unreliable, inconsistent disease control is the biggest reason more and more superintendents are getting back to regularly scheduled applications of Daconil 2787 fungicide. Because Daconil 2787 is the most effective and reliable fungicide you can use on tees, greens and fairways.

Daconil 2787 has a proven record of performance when it comes to delivering superior control of ten major turf diseases including: dollar spot (and benomyl-resistant dollar spot), Helminthosporium (leafspot and melting-out) and large brown patch.

What's more, Daconil 2787 resists wash-off. So it's always out there working even during heavy rains or watering. There's no need to add a costly spreader/sticker for full and even plant coverage because it's already built in to the formulation.

And there's never been a documented case of resistance in over 15 years of use.

Plus you just can't beat Daconil 2787 for economy either. As we've been pointing out for the last two years, Daconil 2787 is the most cost-efficient fungicide you can use from tee to green.

So this season make your fungicide Daconil 2787. It's the one fungicide you can count on to save you from a lot of disease problems and a lot of headaches too.

Overseeding *from page 30*

equal lots and sown on three or four different days.

The seed should be applied in the early morning when the soil is still frozen but is expected to thaw during the day. The freeze-thaw cycles produce a honeycomb or soil cracking that enables the seed to become embedded in the soil.

The results of honeycomb seeding can be improved if the areas are scarified the previous fall with a flexible-tine harrow or similar piece of equipment.

Many landscape superintendents also feel that broadcasting seed on a field just prior to use is beneficial, assuming that the cleats of shoes will push the seed into the ground.

It is unlikely, however, that much of the seed will germinate and survive, especially if applied much past Oct. 1.

Species, cultivar selection

Successful overseeding begins by selecting the best grass species and cultivars for your area. Fields that receive heavy use should be overseeded with a blend of two or three **perennial ryegrass** cultivars at a rate of five to seven pounds of seed per 1,000 square feet. This quick germinating species is well-suited for athletic fields because it has good wear resistance, it is very easy to establish and is better able to compete with weeds when used in a spring seeding.

However, it is somewhat susceptible to winterkill and since it is a non-spreading grass, it's ability to recover from injury is poor. Therefore, more frequent overseeding will be necessary to maintain density on perennial ryegrass fields.

Kentucky bluegrass is also well-suited for athletic field use. It is attractive, durable and is able to recover from injury. The biggest drawback of Kentucky bluegrass is that it is difficult and very slow to establish, especially when overseeded with sod.

Mixtures of Kentucky bluegrass and perennial ryegrass can be overseeded on fields, provided that the perennial ryegrass component does not exceed 20 percent of the seed mixture. Mixtures with a larger percentage of perennial ryegrass will produce a predominately ryegrass stand. The differences in seedling vigor make it difficult for Kentucky bluegrass to germinate and establish itself in a vigorous perennial ryegrass sward.

However, if the vigor of the ryegrass is reduced by close mowing (1/2 inch) for the first few weeks of establishment, then it is possible to produce a true blend of Kentucky

bluegrass and perennial ryegrass from a 50:50 seed mixture.

The preferred grass species for home lawns in the northern United States is Kentucky bluegrass. The many improved cultivars now available have such genetic diversity that there are few situations where at least one cultivar won't be adapted.

There are cultivars adapted to sun or shade, high or low maintenance and they are all attractive. Kentucky bluegrass should be overseeded into a lawn at a rate of two to three pounds of seed per 1,000 square feet. This rate is slightly higher than what might be used in bare soil, but it compensates

The turf type tall fescues are becoming more popular for athletic fields, home lawns and other grounds areas.

for the reduced germination that can be expected in what are often less than ideal germinating conditions.

The turf type **tall fescues** are becoming more popular for athletic fields, home lawns and other grounds areas.

The new fine-textured cultivars have good drought tolerance, good wear resistance and they are much more attractive than the old varieties such as Kentucky 31. Since tall fescue is also a bunch-type grass, more frequent overseeding will be necessary to maintain density and for the cultivars to maintain their fine-leaf characteristics. Also, tall fescue is very susceptible to winterkill, so its use is limited to rather specific areas in the northern United States. Contact your county extension agent or state turfgrass specialist for the species and cultivars recommended in your state.

Seeding

Once the seed mixture has been selected, the area must be prepared for seeding. Mow the area as short as possible and remove the clipping debris. This step will insure that adequate sunlight reaches the soil surface to enhance germination.

Seed is most successfully germinated when it is placed in direct contact with the soil. Core aeration is an effective means to accomplish this.

Core aerify the field or lawn in at least four directions. Germination will be noticeably enhanced directly in the aerifier holes. Therefore, the

more passes made with the aerifier, the better.

Allow the cores to dry, then break them up by dragging the area with a drag mat, piece of chain link fence, or flexible tine harrow. Core aeration prepares a partial seeded by bringing soil to the surface.

Apply a high phosphorous or starter fertilizer with an approximate 2-4-1 or 3-4-1 ratio at a rate necessary to provide one pound of actual nitrogen per 1,000 square feet. Both nitrogen and phosphorous are essential for rapid establishment and maturation of overseeded turf.

Overseed immediately following aeration. The preferred method of overseeding is to use a disk-type seeder that cuts a narrow slit into the soil or thatch and directly deposits the seed into the slit. The areas should be seeded with a disk seeder in at least two, and preferably four, directions.

When bunch grasses are used, superintendents will often broadcast seed on top of the disk-seeded areas to accelerate the filling in-between the seeded slits. This step could probably be eliminated if the area is disk seeded in four directions.

When a disk seeder is not available, it is possible to further prepare the seedbed by working up the soil surface with a flexible tine harrow. Seed may then be broadcast and the area lightly dragged.

On spring-seeded turf, siduron (Tupersan) should be applied to reduce annual grass competition. Siduron is presently the only pre-emergence herbicide safe to use in seedling turf.

In 1986 there may be a new postemergence herbicide available called Acclaim that is effective on many annual grasses and is safe to use in seedling turf.

Water the area as necessary to keep the soil surface moist. Mow the area when the grass seedlings are slightly higher than the height at which they will be maintained.

After the newly seeded area has been mowed at least twice, herbicides may be applied as needed to control broadleaf weeds.

Regardless of the turfgrass area being maintained, overseeding is only one step in producing high quality turf. Controlling the amount of play and providing adequate drainage will help preserve a playable turfgrass cover on athletic fields.

Proper fertilization, mowing, irrigation, cultivation, and controlling turfgrass pests will all contribute to a healthy, vigorous turf and reduce the need for overseeding. **WT&T**

SNAPPER[®] DOESN'T JUST THATCH IT, IT CATCHES IT.

One of the greatest threats to the life of your lawn is thatch. Thatch can starve and strangle a lawn to death through the build-up of dead and decaying material which works like a thatched roof to seal off your lawn's bed. This "thatched roof" prevents air, water, fertilizer and nutrients from penetrating to the roots of your grass, which is especially harmful during the spring and fall when your lawn needs fertilizing.

Fortunately there's an easy solution to this deadly threat that doesn't involve a lot of time consuming raking, raking and raking.

That solution is the SNAPPER Thatcherizer. This affordably priced option attaches to any

SNAPPER Hi-Vac rider, self-propelled mower or lawn tractor. Its gentle but thorough raking action combines powerfully with our unique, patented Hi-Vac system to loosen and vacuum away even the toughest thatch deposits. And when you add one of SNAPPER'S grass catchers, with capacities of up to 30 bushels, you've

got a dependable team that will keep even the largest, most demanding grounds handsome and healthy.

The Thatcherizer is just one more fine example of SNAPPER'S commitment to excellence in lawn care. With a complete line of walk and riding mowers, tractors, tillers and snowthrowers, we have a machine suited for every job; plus a full selection of versatile attachments to help those machines work even harder.

And because they're SNAPPER'S, you know they are engineered for quality, durability, and reliability. Which means fewer problems, and more profit.

So visit your SNAPPER dealer today for a look at the Thatcherizer and the complete line of fine SNAPPER products. Because when it comes to dealing with thatch, and delivering a beautiful lawn, SNAPPER has it in the bag.

It's a snap with

With millions of users, thousands of facilities, the previously neglected turf ballfield is gaining the public's respect. Now it needs public support.

Public Sports Turf: Drastically in Need of Standards

by **Bruce F. Shank**, executive editor, and **Ron Hall**, assistant editor

Orphan Annie and public sports fields have a great deal in common.

Both receive only minimal attention as wards of the state and have the potential to rise to greater status.

The big question is, who will be the Daddy Warbucks of public sports turf?

A significant number of organizations, including this magazine, are trying desparately to find the answer. A summit of all major public sports turf groups was held at the USDA Turf Research Center in Beltsville, MD, in late April to get the ball rolling.

The public sports turf market has the potential to expand the overall turf market as the professional lawn care market did in the 1970's.

This long-delayed market will boom because the public is demanding better, safer fields while public agencies face increased liability for injuries occurring on public fields.

Greater awareness of injury liability and skillful promotion of safer, better built and maintained fields to Parent Teachers Associations and public field user groups, will cause budget roadblocks to collapse under taxpayer pressure.

Roadblocks are not just financial. Current maintenance levels are recognized as inadequate for intensive use. Field construction standards used to build most of today's fields are resulting in poorly-drained, worn-out fields. A major reconstruction effort will be needed after adequate construction and maintenance specifications are developed.

Maintenance Practices*

| Practice | Percentage of Respondents Doing |
|-----------------|---------------------------------|
| fertilization | 92% |
| weed control | 86% |
| aerification | 73% |
| irrigation | 60% |
| insect control | 36% |
| disease control | 29% |

Scope of need

In 1983, the National Federation of State High School Athletic Associations in Kansas City counted 14,086 schools involved in football, 13,380 in baseball, 14,414 in track and field, and 4,454 in soccer. Add to these figures the more than 12,000 park systems in the U.S. with a varied assortment of fields.

The scope of public sports turf continues to snowball when you consider junior colleges, state universities, and municipal recreational facilities.

Another perspective of the market is provided by looking at the size of public field user groups. There are more than 2.2 million children participating in 7,000 Little League® programs, more than one million kids playing in other organized summer baseball and softball leagues, and 173,000 teams competing under Amateur Softball Association rules. Add the growing popularity of soccer leagues, and extremely serious over-demand for a limited number of fields becomes undeniable.

Liability

This overdemand only becomes important to public field decision makers when kids get injured and the liability of the public agency is threatened. A recent *Weeds Trees & Turf* survey revealed schools and parks carry an average of \$1 million in liability insurance.

Liability insurance used to provide public agencies with comfortable protection against serious fi-

Subdue. The most effective fungicide against Pythium blight and damping-off.

Pythium weather. High temperatures, high humidity and high anxiety. Once Pythium takes root, it can destroy turf within hours.

Unless you take a grass-roots approach to Pythium. With Subdue.

Subdue works both on contact and systemically.

Subdue fights Pythium blight and damping-off—as well as downy mildew (yellow tuft)—in two ways. On contact, Subdue destroys

the fungi in the soil. Systemically, Subdue prevents disease from within grass plants. That's because Subdue is water soluble—easily absorbed by roots. So Pythium—and now, downy mildew—don't have a chance.

Subdue also controls costs.

Subdue's systemic action means longer, more effective residual

protection. Fewer applications. Lower chemical costs. And savings in maintenance and labor. And Subdue's low application rate—1 to 2 fluid oz. per 1,000 sq. ft. for 10 to 21 days on established turf—makes Subdue the most cost-efficient protection you can buy.

Before Pythium weather strikes, subdue it. Use Subdue in a preventive maintenance control program. And get a good night's sleep.

HOW TO TAKE OUT SURFACE FEEDERS AND GRUBS IN ONE SWELL FOOP.

To take out surface feeders like sod webworm larvae, chinch bugs, billbugs, and flea beetles, just follow these simple steps.

Step one, get some [®]OFTANOL 2 Insecticide. It's the liquid formulation of OFTANOL. If you think OFTANOL is too expensive to use on surface feeders, check out step two.

Step two, mix it at the *economical rate* and spray where the bugs are. It'll work.

The same product, OFTANOL 2, does a bang up job on grubs. Mix it at the recommended rate and spray it on. Use OFTANOL anytime, as a preventive in the spring or as a curative, whenever grubs are a problem.

Surface feeders and grubs, two serious problems with one serious solution. OFTANOL 2.

OFTANOL is also available in a granular formulation. Always read the label before use.

**OFTANOL 2.

nancial loss to injury claims. But, insurance companies today are actively researching injury rates on public fields for possible rate increases. In the future, insurance premiums may possibly be lower for properly constructed and maintained fields. Then, and possibly only then, decision-makers will move to provide the budgets, equipment, and personnel to keep fields safe.

Demand and injury liability will force public agencies to take field construction and maintenance seriously.

Golf leads the way

The National Golf Foundation was the first to record the growing dominance of the public sports facility in 1983 when it discovered 85 percent of all regular golfers played public courses (daily fee and municipal). Forty percent of frequent golfers played municipal courses, although these courses represented only 16 percent of the total number of all types of courses.

Clearly the golfer is depending more and more on municipal and daily fee courses. In response to increased demand, more municipal courses are hiring contract maintenance companies, such as American Golf Corp., Los Angeles, CA, are growing rapidly.

If an organization like NGF existed for football, softball, baseball, and soccer, a similar or perhaps stronger case for support of public sports turf could be documented. Statistics for both the number and types of fields and number of users are badly needed.

Another sign of concern for public sports turf is the increasing number of former golf course superintendents holding the titles of park superintendent or stadium facility director.

Private sports facilities

In the WTT survey it was discovered only 10 percent of leagues playing on

public fields pay a significant portion of maintenance costs. More than a fifth of the leagues playing on public fields, however, perform some maintenance tasks.

While a public facility by definition should be open to all taxpayers, intensive use by one or more groups should be supported with additional user fees. Intensive use hours can be limited for the benefit of general taxpayers and the turf.

When sports facilities, such as multi-field softball centers, are profitable on a private basis, then two conclusions can be drawn. First, the public is willing to pay for scheduled use of quality fields. Secondly, the quality of public fields is considered sufficiently lower to pay for private fields.

It follows that landscape maintenance contractors can build a case for better sports fields for a reasonable price. The WTT survey showed 11 percent of schools and parks contract out part of athletic field maintenance. Dramatizing this possibility is the fact that 71 percent of the school and park officials polled said they lacked the manpower to accomplish needed sports turf maintenance.

Furthermore, the superintendents responded that equipment expenditures were of most concern to them (64%), more than labor (41%) and more than chemicals (21%). Equipment leasing and contract maintenance are alternatives to rising equipment costs.

Considering that 46 percent of park and school superintendents work with no budget growth and 15 percent with falling budgets, public agencies are being forced to make hard decisions.

Case by case interest

The attitude of public officials in response to public demand is very important to the attention sports fields receive. A winning team or local media coverage may create the dedication needed for adequate field care. More often fields are lumped into the overall physical plant budget simply because they exist, not because they have special needs.

Sports fields must be treated as a unique maintenance function. If the public agency is unable to provide staff for necessary care, then contract maintenance should be used.

Field maintenance contractors need to sell a package specifically designed for sports fields. Bids

should meet recognized maintenance standards for specific types of fields.

Public agencies are currently at a loss for such standards. No national park or scholastic agency can currently provide maintenance standards to local schools or parks. The only way they have any idea of what is needed is to contact extension. Extension often lacks these standards as well.

Without standards budgets are impossible to build. Once standards are developed realistic budgets can be established.

Maintenance budgets for the park and school supers polled by WTT ranged from \$200 to \$3 million. The average maintenance budget was nearly \$250,000 and the median was \$55,000.

When the status of public sports fields is raised to an appropriate level, budgets should not be a problem.

Public golf course budgets are actually higher than daily fee maintenance budgets as discovered in a WTT survey published in the January 1985

Without construction and maintenance standards budgets are impossible to build.

issue. Maintenance and construction standards exist for golf, but not for many other sports fields.

There are roughly 160,000 acres of municipal golf courses in the U.S. WTT estimates there are at least 250,000 acres of public softball, football, soccer, and baseball fields in the U.S. Using National Golf Foundation statistics for rounds played on municipal courses in 1983 (5.5 million), revenue generated by municipal golf courses (\$8 per round) was \$44 million. This revenue paid maintenance costs. Some method of generating maintenance funds for public sports fields has to be considered.

A change in status must begin with development of widely recognized field construction and maintenance standards. Then, and only then, can our public sports fields leave the orphanage.

SUPER-3 P.T.O. MODEL

**SUPER-3
ENGINE
MODEL**

TRIPLEX-376

- Quality
- Reliability
- Service

Super-3 mower

FINALLY A REEL MOWER MADE FOR SMALL TRACTORS
The P. T. O. Model is easily hooked up to any suitable tractor.
The Engine Model is equipped with a 7 H.P. engine. It can also be pulled by trucksters or ATC's.

Outstanding Features:

- Unique and simple mechanical drive system
- Heavy duty mowing units, with a choice of 5, 6 or 7 bladed reels
- Easy reel lift for transport and storage
- Jack stand for easy unhooking and parking
- Designed to deliver a fine quality cut in long, short, wet or dry grass
- Mows up to 40 acres (16.2 ha) per day

Triplex-376 mower

A REAL PROFESSIONAL TRIPLEX MOWER
Improved mowing, quality and styling.
Reels are dynamically balanced to provide a beautiful fine cut.

Outstanding Features:

- Free floating reels with anti-scalp rollers
- Precise and easy height of cut adjustment
- Raise and lower cutting units from operator's seat
- Equipped with a quiet reliable 8.5 H.P. engine
- The transmission has 3 speeds forward and 1 reverse. Also a diff' lock is standard
- Excellent operator comfort and visibility with hand brake as a bonus
- Mows up to 30 acres (12.1 ha) per day

The return of professional baseball to Washington D.C. could mean a bigger crew and more work for groundskeeper Tony Burnett, but he welcomes the challenge.

RFK's Turf Is Major League

by Ron Hall, assistant editor

There's no "Mr. Baggy pants" at Washington D.C.'s professional sports mecca.

Tony Burnett, chief groundskeeper at Robert F. Kennedy Stadium, is decked out in snappy blue blazer, tie, pressed trousers. He's got that spiffed-up, ready-to-go-to-a-party look about him.

The "party" could be the return of

"The majority of the Redskins love natural turf."

—Burnett

professional baseball to the nation's capital.

There's a buzz in RFK. Smiles. People humming. "Hey Tony, howya doin'?" And the long-suffering fans of the nation's capital (They've paid, oh how they've paid!) sense their 15 years penance is ending.

The once-proud Senators— world champs in '33—slinked out of D.C. about 20 years ago and resodded themselves in Minnesota, smack dab in the middle of Injun' country, proud Washingtonians hurrumphed. Then the expansion Senators. They couldn't get over the hump. Small wonder. They traded the left side of their infield (rifle-armed Aurelio Rodriguez at third, steady shortstop Eddie Brinkman) to the Tigers then hot-footed it to Texas. Rodriguez and Brinkman obliged by helping Detroit to the 1971 American League East championship.

"I'd love to see baseball come back to Washington D.C.," says Burnett, who at a youthful 40 years old is putting in his 25th year at RFK. That's a bit hard to believe because Burnett, trim and soft spoken, just doesn't look old enough to have a high-school-age

Valley Forge, Pennsylvania

Finally, you can catch the *entire* lawn care and landscape industry at one exciting show. The new Landscape Exposition will bring together the largest group of landscape/lawn care professionals and suppliers of products and equipment ever assembled in one place. At least 17 markets will be represented!

The Landscape Exposition is being held at the brand new Valley Forge Convention Center in Valley Forge, Pennsylvania, a suburb of Philadelphia. This fine center offers you many advantages including free parking, non-union staff, fantastic hotel facilities, and easy access from major highways and airports.

This exciting show has the enthusiastic support of the Professional Grounds Management Association, Associated Landscape Contractors of America, and Sports Turf Managers Association, and other professional groups. It is sponsored by *Weeds, Trees and Turf* and *Lawn Care Industry* magazines. And it is managed and promoted by HBJ Expositions & Conferences, a division of Harcourt Brace Jovanovich.

Make sales ... find new sales leads ... keep on top of the competition ... see all the newest products and equipment ... share ideas with your peers. Don't miss the largest and most comprehensive landscape show ever!

son (a basketball player) in his household. He looks like he could take a swing or two at the plate himself.

Pro baseball at RFK? "Why not," says Burnett.

"I'm trained as a baseball groundskeeper. Initially I broke in with a baseball team," he says.

That was in 1962. Burnett was fresh out of high school. His boss was Joe Moony. ("He kind of took me under his wing. He's one of the best," Burnett recalls.) And the Senators played in Washington in new D.C. Stadium. Lombardy coached the professional football Redskins.

Lombardy moved to Green Bay, and Moony took over as chief groundskeeper at Boston's Fenway. D.C. Stadium became RFK in 1971, and Burnett became boss groundskeeper.

His number one job since then has been keeping the 'Skins happy; and he has.

'Skins love turf

Natural turf plays a big part in the success of the Redskins, Burnett is convinced. "The majority of the Red-skin players love natural grass."

In the category of "action speaking louder than words" the Redskins delivered an oration in the 1982-83 season. They rolled over Miami 27-17 in Super Bowl XVII as aging Mack-truck-on-legs John Riggins gained more than 100 yards in four consecutive playoff games (a record).

Could it be that RFK's modified Prescription Athletic Turf (PAT) playing surface contributes to Riggins longevity as a power back? Larry Csonka, the former all-pro bulldozer for the Miami Dolphins thinks so. Speaking about artificial turf, Csonka once told writers, "it can finish every player in the league before his time. Let the engineers play on it. I hear there's a guy off somewhere working on a different weather-resistant surface. It's called grass."

But growing grass isn't as easy as it looks, not in D.C., however, which is in the so-called "transition" zone. Burnett tried Kentucky bluegrass after the sand-based PAT system was installed in 1975. He abandoned bluegrass in favor of Bermudagrass the following year even though it goes into dormancy about the time the Redskins start play.

"The last four years we've used three different Bermudagrasses," Burnett says of his field which is re-sodded each June. "Last year we used

419, but I might try a new one next year if I think I can get a better stand."

Much of Burnett's maintenance schedule is now common practice on many professional sports fields: overseeding with a pregerminated ryegrass blend before and after every game, aeration (he uses a Ryan Greensaire II and a piston-driven Hahn Aerifier II) about every 10 days during the Bermudagrass growing season, application of about 1/2 lb. nitrogen in water-soluble 16-8-8 at reg-

"Washington is going to end up with an expansion baseball team."

—Dalrymple

ular intervals, and mowing (he uses a Toro Professional 76 and a Jacobsen Turf King) every other day when the Bermudagrass is growing, twice a week for the ryegrass.

Pros destroy turf

Neither the PAT system (which Burnett swears by) nor good field maintenance procedures can compete with the damage of a professional football team, however. Burnett claims the turf on a professional football stadium starts to deteriorate, particularly in the center of the field, soon after the season begins.

It's the groundskeepers job to slow down the deterioration. That determines his worth.

Says Burnett, "professional football creates a tremendous amount of pressure on a playing surface. College games don't come close. I've had both games here and after a Redskin's game it's like a bunch of cattle have been out there. When those big linemen dig in, they really dig in. And here at Washington they like to run. Those running plays compound the problem."

Vince Lombardi, who coached at D.C. when Burnett started his career, had definite feelings about field maintenance.

"Lombardi once told me, 'I don't care about your blankety-blank-field. Level it out, roll it, and mark it. We'll play on it.' He didn't particularly care about how a field looked, but he wanted it to play good," Burnett recalls.

"You can have the best looking field in the world, but it may not play

well. We are more concerned about the structure of the field than just having it look good. The root structure is more important than the leaf."

When it comes to preparing a field for a game, Burnett says just about anything (including dyeing a field for the television camera) goes. "We do anything and everything to get this field ready," he says. "When the whistle blows on Sunday that field has to be ready. That's the bottom line."

The bottom line for Burnett, however, isn't just RFK Stadium. He maintains a pair of nearby practice fields that are used by the 'Skins in the summer and by area colleges for soccer in the spring. And snow removal in the parking lots of the Starplex complex, which includes the stadium and an adjoining arena, also falls within his responsibilities.

His position is unique. He works for the D.C. Armory Board, a quasi-governmental agency, which manages RFK. Burnett calls it a "beautiful" situation.

"We create our own revenue through events," he explains. "We are not subsidized. That makes it good when we need equipment because when we need a new piece, we go out and get it." With D.C.'s star rising in baseball circles Burnett might be needing additional equipment a year or two down the road.

How close is D.C. in returning to the major leagues?

"Washington is climbing rapidly with the baseball people," Jim Dalrymple, general manager of the D.C. Armory, which takes care of the stadium, says.

"We have a committee that the Mayor has put together and it's been very, very active. There's no doubt in my mind that Washington is going to end up with an expansion baseball team."

Proponents of baseball in the capital have gone so far as to suggest \$16 million in improvements to RFK to entice a new club. Frank Smith, Jr., chairman of the D.C. Baseball Commission, reports that the cost could be decreased by \$1.25 million by keeping a natural grass playing surface.

Optimists in D.C. are hoping for a National League franchise by the end of this year.

"I don't know how a baseball team would affect me right now, but I know it will mean a bigger crew," says Burnett. "And," as he flashes a broad smile, "a whole lot more work. I'm excited about having baseball again."

WT&T

COME TO THE FEAST

IRRIGATION IN ACTION

November 17-21, 1985 • Fresno, California, U.S.A.

The International Irrigation Exposition & Conference
sponsored by The Irrigation Association

A Feast of Knowledge—140 speakers will discuss sprinkler, surface, and drip/trickle systems applied to landscapes and field, tree and vine crops of all types. Experts in every phase of irrigation will lead technical sessions probing new methods of cost-efficient water application under all kinds of growing conditions. The Third International Drip/Trickle Irrigation Congress sponsored by the American Society of Agricultural Engineers will be held together with IRRIGATION IN ACTION.

A Feast of Opportunity—Over 400 exhibits will display the newest and most technically advanced irrigation products and services. If you're looking to buy, you can compare products and prices side by side. If you're seeking lines to sell, you'll meet senior managers ready to reach agreements and officers of the U.S. government eager to assist you.

A Feast of Experience—Fresno, California lies in the heart of the irrigation center of the world. Over 200 crops are grown here using every kind of irrigation technique, and 30 factories in the immediate area produce irrigation equipment. Many of these farms and factories will be holding field demonstrations and daily organized tours.

Reserve your place now. For more information please fill out and mail this coupon.

Fichter's Rule: "The impetus for good fields must come from the users. If the public demands good fields, then we'll have to provide them."

Ann Arbor's Soccer Showcase

by Ron Hall, assistant editor

He's 39. His dark hair is flecked with gray. He's not given to pronouncements. But, Gary Fichter, the top turfman in the Ann Arbor Department of Parks and Recreation, says a community's athletic fields will only be as good as a community demands.

Fichter likens sports turf to something he's more familiar with, golf. When weekend golfers began demanding the types of courses they saw on television, the entire golf maintenance industry benefited. Fichter says the weekend athlete has some catching up to do.

"Right now, I don't really know if the public wants good athletic fields,"

Fichter notes. "I mean, how far is the public willing to go to get them? I don't often hear those good hard questions."

It's a curious pose for the city's golf course superintendent. But the Cleveland, Ohio, native with a luxuriant brown moustache has a lively six-year-old son playing in the local soccer league and a daughter waiting in the wings. Also, his experience in turf makes him a valuable helper in the park department's athletic field maintenance.

But, back to Fichter's Rule, and a group of citizens, the Ann Arbor Soccer Association (AASA), who help prove it.

Fuller Park

The AASA pushed for top-rate playing facilities. A progressive city responded. The result is city-owned Fuller Park, a picturesque soccer complex tucked in a bend of the serpentine Huron River.

The Fuller Park soccer fields now showcase some of the best amateur soccer in Michigan. The fields are used by the AASA which provides top-level competition for 400 adult and 500 adolescent players. These are the skilled soccer players in this college town of 115,000, that lays claim to being home of huge Michigan University.

A few years ago Fuller Park was

Fuller Park soccer fields—a lush landscape from the air.

WHAT MAKES RYAN'S BIG AERATORS WORTH THE INVESTMENT:

Chances are, your turf is slowly choking to death.

Every time you cut grass, it gets harder for water and fertilizer to seep down through the thatch build-up.

And every time your soil is walked on, or dried out by hot weather, it gets harder for the grass to breathe.

And for new grass to take root.

Ryan has the solution.

Ryan solves your turf problems with an aerator specifically built for your type of turf.

On fairways, parks and other uneven grounds, we offer the Ryan Renovaire®.

To aerate flat expanses of turf (like athletic

*Large area cultivation
plus five choices of tines to get
to the root of your
problem fast.*

The Ryan Tracaire — built specifically for athletic fields and other flat grounds.

fields), choose the Ryan Tracaire®.

Both cover a wide 6-foot swath.

The Tracaire can be mounted to your tractor's 3-point hitch.

The Renovaire is pull-hitch mounted.

And both let you vary the amount of aeration with a unique system of interchangeable tines: two sizes of **coring** tines for the fast-growth weeks of spring.

Two sizes of **deep-slicing** knives to open up dry soil in the summer.

And **open-spoon** tines to prepare the turf for new seed and fertilizer in the fall.

No other equipment gives you such thorough aeration season after season.

A free demonstration.

See the Ryan Tracaire or Renovaire in action. Call us toll-free:

1-800-228-4444.

Or write: 2262 Cushman, P.O. Box 82409, Lincoln, NE 68501.

RYAN®

It works harder because it's built better.

part of a sagging 18-hole golf course. In the mid-1960's the course was reduced to nine holes, and in 1974 abandoned altogether. For a few years at least, Fuller Park sported little more than a healthy crop of weeds.

The Association's move to Fuller in 1978 wasn't without a few rough spots. Indeed, when the AASA began play, the park resembled what it had been, a broken down golf course. Scoring paths to the goal often took players over dilapidated tees and greens. Turf on the natural-soil fields at Fuller Park disappeared under the pounding of intensive spring and fall play.

Fuller wasn't safe for soccer.

The AASA asked for help.

Help needed

"About three years ago we offered to match money to regrade and resurface the fields," AASA President Hugh McPherson says "Then about a year after that the city ran a park millage, and we again approached the city, this time about putting in irrigation."

Ann Arbor and the Association inked a five-year pact that would see the city contributing \$100,000 in materials and services. The AASA puts up \$15,000.

So far the financial arrangement seems to be working well, although there is a slight disagreement over the condition of the playing surfaces.

"It's got to be the nicest soccer facility in the state," says the AASA's McPherson.

"I think they were expecting a Mercedes. When I only delivered a Cadillac, they were disappointed," says Fichter as he surveys the grass soccer fields.

McPherson is obviously pleased with improvements at Fuller. The turf, however, is still not what it should be, Fichter feels. Years in golf course maintenance (and a stint in his own lawn care company) make him his own worst critic.

After earning a B.S. degree in agriculture from Ohio State University, Fichter switched directions by going heavy into turf. He served as assistant superintendent at Sylvania Country Club, Toledo, OH, before an eight-

Gary Fichter, Ann Arbor Parks and Recreation Department.

year stint as superintendent at Ironwood Golf Club in Northwestern Ohio, "a real learning experience," he recalls. He helped develop the then-new Ironwood course. Several years in his own lawn care company preceded a move to Ann Arbor.

In the two-plus years he's been in Ann Arbor, Fichter has taken solid steps in rebuilding the playability and popularity of the public Leslie Park and Huron Hills golf courses. His turf training allows him to help with the ball diamonds and soccer fields, too.

The rebuilt Fuller Park fields could be his showcase.

Renovation begins

Renovation began with a regrading of Fuller in August 1982. Workers removed tons of topsoil and stockpiled it for reuse. No other topsoil was added. This was a "good news, bad news" situation. The original soil consists of loamy sands which drain well but are "droughty", not the best environment for strong, young athletic turf.

Next, a Brillion seeder spread a mixture of grasses—25 percent Adelphi and 25 percent Parade (both Kentucky bluegrass), 25 percent Galway (tall fescue), and 25 percent NK200 (perennial ryegrass) at a rate of 150 lbs. per acre. The fields were mulched with straw, two tons an acre. Fertilizer, 12-12-12, preceded seeding.

Fichter reports germination "was only slightly satisfactory" by the spring of 1983 with a turf cover of

about 50 percent, and 95 percent of that ryegrass.

More work was needed.

Irrigation added

In 1983 funding became available for irrigation, and Fichter oversaw the installation of a Toro system which sucks water from the bordering Huron River to a wet well and then to the Toro 640 pop-up heads. Fichter says the addition of irrigation might be the key to Fuller Park's soccer fields.

Prior to irrigation in mid-summer 1984, the fields (overseeded in May with Kentucky bluegrasses Adelphi, Baron, Eclipse, and Glade) showed only a 50 percent cover. With the addition of irrigation, use of Trimec for broadleaf control, and applications of 29-0-14 at 1½ pounds N/1000 in August and 1 pound N/1000 in September, "turf quality improved immediately. . . we had 95 percent cover of quality turf with 50 percent being Kentucky bluegrass," he explains.

Now that the agronomic pieces are in place, Fichter wants to finish the puzzle of Fuller Park's turf with a strong maintenance program.

Says Fichter: "Right now the top priorities for these soccer fields are building up fertility levels, aeration, weed control, and overseeding."

The 1985 season should see the fields getting four applications of 29-0-14 at 1 pound N/1000, broadleaf weed control as needed, and a mid-summer aeration with a Dedoes trailer-type aerifier. The turf will be maintained at a 1½ -inch cutting height with a Brouwer 7-gang mower.

Overseeding is a big part of the program, but Fichter needs the help of the Association. "We're going to give them the seed and ask them to apply it to the goal mouths and other high use areas on a weekly basis," Fichter says. At least two different types of perennial ryegrasses will be used. In August the entire complex will be overseeded using a Jacobsen thatcher/seeder.

"Right now I don't know if the public really wants better athletic fields. I don't know if they're ready to demand them like golfers demanded better courses," Fichter says.

"The soccer association asked the hard questions. It said, 'look at those fields. They're atrocious' and it acted. You wouldn't see nice fields at Fuller if that group wasn't behind it."

Or if Fichter didn't think he could do a bang-up job with the turf. **WT&T**

Here you see our finest products. But not our best work.

Our finest products are lush, green, and vigorous. Our best work is knowing we can stand behind them.

Years of field experience. Continuous research. Nationwide testing. All these are hidden in every blade that sprouts from a Northrup King Medalist® Turfgrass Mixture.

HOW TO GET THE BEST DISEASE CONTROL FOR LESS COST THAN THE SECOND BEST.

To get the most effective control of diseases like dollar spot, Fusarium blight, anthracnose, and others, you don't have to spend the most money.

®BAYLETON Turf and Ornamental fungicide actually costs you less than products that aren't as good. The reason is the way it works. BAYLETON works *systemically*, inside the plant, through both foliar and root uptake. So, control lasts—up to 30 days and sometimes longer. That means *fewer* applications. And that saves you time, manpower, and money.

Use BAYLETON for preventive or curative control of dollar spot, copper spot, powdery mildew, red thread, and rusts.

And use BAYLETON as a preventive, before diseases strike. Stop dollar spot, Fusarium blight, anthracnose, stripe smut, Fusarium patch, and pink and gray snow molds.

Diseases, many serious problems with one serious solution. BAYLETON. Always read the label before use.

**BAYLETON.

The Cincinnati Bengals professional football team counts on a local maintenance company to give it good practice conditions at Spinney Field.

'Practicing' Class

by Ron Hall, assistant editor

Bengals work out on two-year-old PAT facility at Spinney Field in Cincinnati, OH

Not exactly chump change \$28,000, not even in the megabucks world of professional sports. It buys a lot of turf maintenance on the Cincinnati Bengals practice fields at Spinney Field.

The Bengals management feels it might be the finest practice facility in the National Football League. The two-year-old Prescription Athletic Turf (PAT) field is cared for by a private Cincinnati company, Motz Environmental Services. The adjoining synthetic grass practice field is just a year old.

Money counts

Contrast this with the \$1,600 the schools at Goshen, IN, budget for the

**"You can't aerate
too much"**

—**Motz**

care of their football fields. The *dollar* might be the single greatest variable in the equation of providing athletes

with safe playing conditions, not that it always tells the complete story.

"I think we provide excellent conditions at our fields on a reasonable budget. As a taxpayer, I know this is appreciated," says Richard Kercher who advises in the care and maintenance at Goshen's Foreman Field, one of the first PAT fields built about 12 years ago. Kercher's efforts are voluntary. That's often the way it is in many budget-strapped schools and park departments.

The gulf between the care of professional and playground sports fields

THIS TEST WON'T HOLD WATER —OR AIR.

Water passes easily through highly permeable Duon Weed Control Mat.

Just blow through Duon to see how easily air passes through it.

The proof is stronger, longer lasting plants with **DUON**[®] Weed Control Mat.

Both water and air pass easily through Duon Weed Control Mat, made of Phillips Fibers non-woven polypropylene. As a landscaper, you know how important that is to a plant's root system and to the future well-being of your big landscape jobs—especially those you use as references.

When water and air can't get through, plants die. Black plastic won't work for the long-term. And woven polypropylenes are nowhere near as permeable as nonwovens. For example, the air permeability for nonwoven Duon is about 14 times greater than for woven polypropylenes and the water

permeability for Duon is about 10 times greater.

Put our words to the test. Hold Duon under running water, then take another piece and breathe through it. Then try the same test with a competitive weed control mat.

When covered from sunlight, Duon is virtually permanent. It allows plants to thrive and impedes about 95% of weed growth (in most areas). It also keeps mulch from going down into the soil.

For your quality landscape jobs, order Duon. For further information, call Phillips Fibers (803) 242-6600.

seems to be widening regardless of the number of athletes using them or the amount of wear they receive. The numbers that count are \$\$\$ numbers.

Barney Barron, superintendent of parks in San Francisco, last fall provided members of the Sports Turf Managers Association with a comparison.

Candlestick Park, home of the San Francisco Giants professional baseball team, is maintained by a four-

The gulf between the care of professional and playground sports fields seems to be widening regardless of the amount of wear they receive.

man crew and budgeted \$75,000 for supplies. The turf is mowed three times weekly, aerated four to six times annually, fertilized every seven to 21 days (or as needed), and treated with fungicides as a preventative measure every 10 to 21 days. In six months 81 games are played there.

In contrast, a typical ball diamond in a San Francisco park might host 81 games in four weeks, is mowed weekly, aerated once, fertilized twice, and is treated with fungicides on a remedial basis only. The combined budget for all park diamonds is \$165,000. Significantly, Candlestick brings in revenues of about \$1 million while the public diamonds don't generate enough cash to cover their expenses.

Big business

Professional sport is a business with television contracts exceeding the GNP of some third-world nations and almost incomprehensible salaries. Organizations view the health of players as an investment, and professional teams like the Bengals cast an exacting eye to practice fields. They'll pay for professional service.

"It's worked out quite well for the Bengals," says Joe Motz. "Our contract has come up for renewal twice and they've had two opportunities to look at it. They're very shrewd business people."

Motz (pronounced like "most")

came on site in August 1983, shortly after the sand-concept PAT field was constructed by Dixie Irrigation, Louisville, KY. Actually the PAT concept field with its sub-surface irrigation covers 2.3 acres of Spinney Field, an area considerably larger than a football field.

The turf, a combination of five different varieties of Kentucky bluegrass, is kept full by spot seeding with a mix of sand, Michigan peat, and perennial ryegrass. Pre-germinated perennial ryegrass, a trick borrowed from Kansas City groundskeeper George Toma, is used when time is a factor. "Toma's pre-germination tactics were a tremendous boost to the entire industry," says Motz, a 1977 graduate of Ohio State University.

The turf field is mowed weekly with self-propelled reel mowers. Tupersan is used as pre-emergence (usually in conjunction with seeding), and this season Motz says he will be using eight pounds of nitrogen 4-1-2 (he used 12 the first season) to feed the grass.

The PAT field requires special handling, Motz relates, including lots of aeration "to prevent sealing off the surface" and the addition of tons of sand. "You can't aerate too much. We go four to six passes and then we bring in 40 to 45 tons of sand to fill in the cores," says Motz. "We pour a tremendous amount of sand onto our fields."

"We feel the practice facility should be in just as good shape, or better, than the playing field"

—Motz

As far as irrigation, Motz believes in letting the turf "call for water" before turning on the sprinklers. Spinney is equipped with both sub-surface and surface irrigation. "You don't want the turf too lush," he says, "but you've got to have it moist enough that it provides firm footing."

Motz says the agreement his company has with the Bengals is mutually beneficial. The \$28,000 cost also includes the cost of maintaining 3/4 acres of perimeter area and marking the fields on a bi-monthly schedule.

"We feel the practice facility should be in just as good shape, or better, than the playing field," he says. **WT&T**

A new softball complex in Tucson is free enterprise's answer to the question of providing quality playing conditions for weekend athletes

Paying to Play

by Ron Hall, assistant editor

Rising moon signals the rise of slowpitch softball that is played into the night on many fields. The inset shows Jim Munson (left) discussing mowing of Sports Park field with Jim Hilkemeyer and groundsman Ed Rostenhausler

In the shadow of the craggy spine of the Tucson Mountains, "pay for play" softball is digging its cleats into the alien (at least in Southern Arizona) softness of moist Bermudagrass turf.

Private enterprise is in the softball business in a multi-million dollar way. It is building fields, signing up leagues, and scheduling games.

Here in Tucson the profit approach to what was previously a park and recreation department service is just getting off the ground.

"It's not proven yet that this is a money-maker," says Jim Hilkemeyer, one of the partners in Tucson's six-month-old Sports Park located on a leased 50-acre tract in an otherwise undeveloped Pima County park. "There is no formula in this industry yet."

Pieces in place

Indeed, there isn't, but the pieces for success—at least at Sports Park—are in place.

With melted-butter afternoons, neon sunsets, and 2,000 new residents each month, the greater Tucson area is vibrating with energy. And public agencies, like park and recreation departments, are straining to meet the demand for services. Slowpitch, a game that was foreign here just 12 years ago, is exploding in interest and participation, and outgrowing the ability of a "land rich, but cash poor" parks and recreation department to serve it.

That's not the case everywhere, however.

While new private softball com-

"You can't have a good softball complex without irrigation"

—Swint

plexes are sprouting in Albuquerque, Cincinnati, Houston, Los Angeles, and Atlanta, others have germinated, flourished briefly, then withered in the heat of poor business practices or competition from public facilities which usually charge

lower team entrance fees.

"These facilities (private complexes) are businesses. They've got to be run like businesses and not play toys," says Chuck Hawke, the young pro shop manager at Miller's Woods

These facilities are businesses. They've got to be run like businesses and not play toys"

—Hawke

softball complex in Overland Park, KS, one of the more established and successful of the private parks. Miller's Woods accommodates many of the approximately 1,000 adult teams in the Kansas City-Overland Park area, and its summer leagues are almost at "the saturation point," Hawke reports. Just 15 years ago barely 100 adult teams played slowpitch softball in Kansas City.

The bottom line of building a profitable ballyard is attracting ball players, their wives and families, and keeping them at the complex for more than just a seven-inning, one-hour-limit game. The payoff comes from the sale of everything from softball paraphernalia to suds and pizza.

The carrot on the stick is professional-style grass playing fields.

"Unfortunately, most of the people who take care of softball fields don't really know how to take care of them," says Jim Swint, who manages Fun Valley in a contract agreement with the City of Hutchinson, KS.

First class fields

With investments like the \$1.3 million it took to build the six softball diamonds and two club houses at Tucson's Sports Park, providing first-class playing surfaces is critical to the success of the private softball park idea.

It's also a mammoth job.

The turf at these private parks is pounded by almost daily use, in Tucson from March to November. Eighty five teams used the Sports Park fields

this spring. During the peak of the season the number of teams could jump to 300. At Miller's Woods an estimated 8,000 contests are played on eight diamonds, while at Fun Valley in Hutchinson, KS, an estimated 5,000 games are divided on seven diamonds. Each field might be used as many as four times a day for up to eight months.

Jim Munson, a former supervisor for Pima County Parks and now general manager of Sports Park, says overseeing the care of his fields, sodded with Midiron Bermudagrass last January, might be his most exacting task. "We want to provide all the things a softball player needs and some of the things he often can't get at a public park, including quality play."

Golf course approach

The management of Sports Park borrows from the golfing industry in its approach to field maintenance.

"We want to keep everything as attractive as we can, like on a golf course," Hilkemeyer says. The Bermudagrass is overseeded with annual ryegrass for an early spring greenup. The turf is babied with smaller equipment.

Mowing—it takes about an hour per field—is done with a Toro Turf-Pro reel mower, and the clippings are immediately gathered by rows of sweepers pulled by a Honda Big Red ATV with turf tires. The ATV also pulls sprayers, aerifiers, and the Maxwell Steel Company scarifier/drag for the infield grooming.

Irrigation, however, might be the key to keeping these private parks first rate.

At Miller's Woods they played for 43 straight days without rain last summer. The park's irrigation system literally sucked a nearby creek dry, and the fields had to be irrigated with city water.

"You can't have a good softball complex without an irrigation system," says Swint, executive director of the 60-member Softball Owners and Directors of America (SODA). Most of the owners of private complexes are members of SODA, a four-year-old association which began four years ago with just five members.

Conservation questions

In arid Tucson, the largest American city to be supplied exclusively by wells, irrigation is essential—and touchy. The nearby Santa Clara and Rillito Rivers are a ribbon of dust by the time they approach the city for much of the year, and newly constructed golf courses are ordered to use only effluent for irrigation. Although the Central Arizona Project will divert water from the Colorado to a reservoir in the mountains just south of the city within the decade, water will likely remain a political issue for rapidly growing Tucson.

The Rain Bird sprinkling system at Sports Park takes its water from a well located near an old landfill site which qualifies it for use in irrigation. But developers of the complex also used some clever design techniques to conserve water.

By constructing a major-league-style warning track just inside the home run fence and extending the dirt portion of the infield an extra 10 feet beyond the bases, the amount of turf at each field is reduced. Less turf,

less mowing, less needed water.

Another obvious benefit of the warning track is the elimination of mowing and trimming along the 10-foot-high fences.

Conservation also prompted the installation of drip irrigation and bub-

“It’s still taboo to charge the kids, and it should be”

—Hilkemeyer

bler systems to nourish the hundreds of quick-growing oleander which should green out and provide a solid green backdrop behind the home run fences.

Other drought resistant plantlife at Sports Park include jasmine, native mesquite, eucalyptus, and Mondale and Aleppo pine, two natives of the mid-east well suited to arid Tucson.

Softball, and its manicured and heavily maintained fields, is the primary drawing card to these new turf recreational complexes, but Hilkemeyer, who has been in both the bowling and skating businesses, feels more attractions might still be needed to make the project payoff. Sports Park also offers volleyball on professional beach-type courts. A Bermudagrass soccer pitch for adult leagues is on the drawing board. Eventually a mile-long “people trail” for jogging and bicycling should encircle the 50-acre complex.

“We’ve tried to design a situation where people will want to stay longer,” says Hilkemeyer, a situation “where it’s convenient for people to spend an extra buck.”

Hilkemeyer does not foresee the growth of private ball yards for youth leagues (Sports Park allows the use of its fields for special youth events) because it’s “still taboo to charge the kids, and that’s the way it should be.”

Adults, however, “They have to pay to play.” **WT&T**

CORE AERIFY WITH DEDOES 3 PT. HOOK-UP

FEATURES

- Standard 3 point tractor hook-up
- Patented hinged tines
- 2, 3, 4 or 5 drum units
- 36-60-120 tines per drum combinations
- Option of collecting plugs
- Heavy duty weight box
- Low cost maintenance

FAST-EASY AND EFFECTIVE

MODEL H

If you are responsible for strong healthy attractive grass and are concerned with saving time and money, investigate Dedoes quality aerators. We have units that fit most utility carts, garden tractors, full size tractors and units that can be pulled by most utility type vehicles.

Call today and see our complete quality line of grounds maintenance equipment.

HOW TO TELL IF YOU'RE USING THE BEST COMMERCIAL MOWER AVAILABLE

Some would have you believe that all commercial mowers are equal. It's easy to find out if it's true.

Check

for engine options and controls that are functional, efficient and match your needs.

Look

for the assurance of performance in commercial mowers for over 30 years, the Buntun name.

Inspect

the finish, workmanship and quality of materials for season-after-season reliability.

Examine

the construction to see that it is heavy gage welded steel plate, not formed sheet metal.

Compare

the lawn, turf and mulching types and sizes available to match the terrain you maintain.

Test

the quality of cut by calling 502-966-0550 for the name of the Buntun dealer near you.

Buntun builds 'em better.
BUNTON CO.

Advanced Technology Helps Sports Turf Managers Leave the 'Dark Ages'

by Dr. Kent Kurtz, executive secretary, Sports Turf Manager's Association

The primary challenge of the sports field manager today is to bolster his prestige and decision-making image, while continuing to gain agronomic knowledge. His hard-earned experience and the varied nature of his responsibilities warrant it. The initial target of these efforts should be management.

The tools are present.

In addition to such aids as the new generation of computerized sprinklers and hardier and more wear-resistant turfgrasses, today's sports turf manager can turn to the Sports Turf Managers Association (STMA). An infant organization, it could be the best bet turf field managers have in gaining the professional status they deserve.

GCSAA a model

Sports turf managers could learn much from the success of related organizations; one of the most successful is the Golf Course Superintendents Association of America (GCSAA).

The GCSAA, over a 60-year journey of education, testing, and image building, has elevated the *occupation* of greenskeeping into the *profession* of golf course superintendent. The GCSAA's continuing efforts are highlighted in an annual conference and strengthened by regional seminars and education programs.

The sports turf manager's path to professionalism needn't be as lengthy because of the model of the GCSAA.

The future

The era of the computer is here to stay. It is making inroads into the Green Industry. Computers speed inventory. They take much of the guesswork out of irrigation. Knowledgeable

Management Tools for Sports Turf Managers

- Computers
- New Turfgrass Cultivars
- Geotextiles
- Pre-germination
- Improved Turfgrass Equipment

sports turf managers are learning that computerized irrigation systems can apply water based upon soil moisture levels, climatic variations, or the needs of specific turfgrasses.

The potential of computers appears to be limitless. As more software is designed and developed, new groundskeeping uses will emerge.

Telecommunications offers sports turf managers exciting benefits. One phase of this new field is teleconferencing. It permits two or more groups to communicate via satellite using television or video screens. Imagine fixing a complicated piece of equipment while a manufacturer's engineer "walks" the repair through on a television screen.

Videotapes can be used to solve problems, provide information on maintenance practices and research, and stimulate the development of new concepts. Rarely used in sports turf manager's offices now, they will

become as commonplace as rakes in the near future.

New turfgrass cultivars

Plant breeders are beginning to unlock secrets in the hereditary complex of turfgrasses. New techniques promise that within a few years genetic engineering and tissue culture methods will allow plant scientists to develop sports turf grass that has even better wear tolerance, recuperative potential, color, tolerance to low mowing, and more rapid establishment qualities.

New warm season grasses which indicate potential for sports turf, appear to be selected zoysiagrass cultivars from the University of California, particularly 'El Toro' and possibly one or two others. Tifway II hybrid bermudagrass has the capabilities to perform better than Tifway. 'Excalibre', which is Seashore Paspalum, needs more time to prove itself as a sports turf. Californians are still waiting for a brilliant geneticist to develop a finer-textured cultivar of Kikuyugrass.

Cool season grasses adapted to athletic turf are limited to a few species which include the bluegrasses (Kentucky and roughstalk), the ryegrasses (perennial and annual), and the fescues (turf-type tall and creeping red).

Proprietary cultivars come and go. Experienced turf managers have learned to check with the agricultural universities in their areas, attend field days, and consult with turf farm advisors or representatives from reputable seed companies and sod nurseries.

New soil media

Work started in the late '60s and early '70s with sand media has dramatically influenced sportsfield construction. Sand in the medium particle range is needed because it does not compact, drains well, and provides a firm play-

Dr. Kent Kurtz is the executive secretary of the Sports Turf Manager's Association, 1458 N. Euclid, Ontario, CA.

ing surface. Field construction concepts and techniques developed around the sand concept include: PAT, Hy-Play, Sportsturf Fields (TD, INTERLINK, and MOD), and Cell-system. Some of these combine moisture sensing, soil heating, sub-surface irrigation, maximum drainage, field pumps, and insulated covers. Any of these systems, if properly implemented and maintained, performs well.

Geotextiles

New geotextile (ground cover) materials are available. They're finding increased favor with sports turf managers. They've proven successful in saving turf during periods of severe wear (concerts, marching bands, motor events), improving field drainage, and protecting turfgrasses from winter injury and desiccation. Even more imaginative uses of these materials are expected.

Accelerated propagation

An idea doesn't have to be new to be useful to today's grounds manager. The idea of pre-germination of grass seed has been around a while, but its popularity is just catching up with its usefulness. To promote the quick es-

tablishment of overseedings, pre-soak the seed for several days until germination, then combine the soaked seed with a carrier (sand, organic fertilizer, amendment). It's a simple technique. It can save days.

When polyethylene perforated with holes is placed over a prepared seedbed or pre-soaked seed, the polyethylene creates a greenhouse envi-

The idea of pre-germination of grass seed has been around awhile, but its popularity is just catching up with its usefulness.

ronment and accelerates the establishment of grass.

Turfgrass equipment

Most of the changes in turfgrass equipment in recent years consist of improvements in old designs. Equipment is larger, wider, more reliable

and versatile. Improvements in vertical mowing equipment, aerifiers, and larger, more versatile topdressing equipment are noticeable. New companies are expected to develop equipment specifically for athletic field use.

Chemicals and fertilizers

It is in the area of chemicals and fertilizers that the greatest thrust for new products is occurring.

Fertilizers that release nutrients uniformly and over several months are on the boards. Some of these new products will not be dependent on specific weather conditions to release their nutrients.

Growth regulators which reduce seedhead production, maintain superior color, and reduce mowing frequency are close to being perfected and introduced into the turfgrass market. New and improved herbicides, insecticides, and fungicides with broader spectrum systemic qualities are being evaluated and will be available within a short period of time.

With all the activity currently taking place in the sports turf field, and the movement under way to build a professional image and organization, the future of the sports turf manager is on the rise. **WT&T**

CONTRACT & EXHIBIT INFORMATION

WHAT HAS PLCAA DONE FOR YOU LATELY?

TAKE A LOOK.

If you haven't checked out the Professional Lawn Care Association of America recently, then you're in for a surprise. We're offering a bundle of

new benefits that make joining PLCAA more rewarding than ever! We even have a new name for our service—**The ProSource**. Here's what we've been up to and how you can benefit:

- ✓ **NEW! Employee Life/Health/Disability Benefit Program.** A program designed with your business in mind. It offers flexible, comprehensive Life/Health/Disability group insurance that you can tailor to the needs and budget of your company.
- ✓ **NEW! PLCAA Safety Manual.** Emergency procedures, pesticide safety procedures, inspections, health programs and more—a complete, practical safety guide for reference and technician training.
- ✓ **NEW! PLCAA Management Monograph Series.** In-depth, easy to understand reference booklets on subjects vital to the operation of your business.
- ✓ **NEW! Legal Update Bulletin.** An exclusive monthly bulletin for members. Edited by PLCAA Attorney, Richard I. Lehr, and focused on tax, investment, labor, and legal information of interest to the industry.
- ✓ **NEW! Public Issues Alert Committee**—continually updates the membership on regulations and legislation—local, state, and national—that affect the lawn care industry. A resource for understanding and involvement in the public issues vital to the future of your business.
- ✓ **Plus a Whole Lot More...** PLCAA membership offers, in addition to these new benefits, an impressive lineup of publications and programs that are invaluable to any lawn care business: • **PLCAA Technical Resource Manual.** An important guide for helping to operate your business on a professional and agronomically sound basis. • **Turf Talks,** PLCAA's bi-monthly member newsletter. • **PLCAA Regional Seminars.** Intensive, one-day sessions offered on a regional basis and at a reduced fee to members. • **Annual PLCAA Conference and Show.** The week-long gathering of the best in lawn care that has become the one must convention of the year. • **The Professional Lawn Care Credit Association**—On hand to help you meet your delinquent account collection needs. • **Insurance Clout**—Comprehensive Property and Casualty Insurance that offer members excellent protection at competitive rates.

No matter how large or small your operation, the **ProSource** is your source for the best, most meaningful lawn care information and help. Your membership investment goes to work for you immediately—that's the PLCAA promise. Join now and grow with us!

had to lift 80 lb. bags of seed or fertilizer. When we were planting trees I had to move 250 lb. root balls. And I did it."

The poll uncovered more than a few companies that agree with Merritt, companies that look favorably on women laborers, foremen, and technicians. Several claim females are more conscientious than men in their work habits (not tardy or absent as often), perform finish work well, and take better care of tools and equipment.

Even so, three out of four women newly incorporated into the landscape and lawn care industries (73 percent to be exact) end up in the office. Employers are more apt to hire a woman to keep the books, for her secretarial skills, or in a clerical or receptionist capacity.

Another area where women might have an advantage is in sales, the poll suggests. "In a corporate setting, they can get in the door when a man can't," one respondent notes. Another points out that women are a natural for selling lawn services "because 54 percent of decisions to buy lawn services are

made by women."

Approximately one third (27 percent) of the companies polled by LCI claim to "actively seek women applicants to fill specific jobs" within their companies. And 41 percent believe women can "outperform men" in certain jobs.

The survey hints the reason why more women haven't made significant inroads into the landscape and lawn care industries is that there is a shortage of qualified women seeking positions.

"I think the number of women will increase," one company executive notes. "I would not hesitate to hire a qualified female, but rarely does one apply." Another says, "for five years I've advertised for male or female help. And not one female has answered."

Says Smithlin, "There's no question I'm being more recognized as a part of this industry. Most women probably don't think they can handle it because it is so male dominated."

It could be that Merritt and Smithlin, and others like them ("survivors," one respondent describes them) are a step ahead in these basically male industries.

Worksaver spreaders team with ATVs

The complete, 24-model line of Worksaver rear-mounted seeder/spreaders includes units designed for use with all major makes of all terrain vehicles (ATVs).

Worksaver says an ATV-mounted seeder/spreader covers confined or rugged areas impossible to reach with a tractor, is not destructive to soft or muddy ground, and handles smaller

jobs more economically than manual seeding.

Each seeder/spreader is equipped with a one-bushel hopper made of corrosion-resistant polyethylene, and features seed gate control and vari-

able fan speed. A hopper lid eliminates the loss of seed or fertilizer to the wind. Splash guard, 12-volt motor, and complete wiring harness are included.

Roto-Hoe shows four new shredder models

Shredding vines, stalks, and tree prunings shouldn't be a problem with an assortment of new shredders being offered by Roto-Hoe.

Smallest of the new offerings is the Model 500 with either 6 rigid tine-type tines or 21 hammermill knives and a 3 or 5 hp Briggs and Stratton engine. The unit is 23 $\frac{1}{2}$ -in. wide and 38 $\frac{1}{2}$ -in. high.

The largest is the Model 2000 which comes standard with 44 flail or hammermill tines, an 8 hp Tecumseh engine (with cast iron sleeve), and is 40-in. wide and 38 $\frac{1}{2}$ -in. high. Roto-Hoe also makes two models (the 550 and the 800) in between the 500 and 2000.

All units feature side feed for vines and tree prunings up to 1 $\frac{1}{4}$ -in. in diameter and a top hopper for lighter materials like leaves and grass clippings. The units are made of 12-gauge steel with 16-gauge top and side hoppers.

HUSTLER Hi-Lift BAC-VAC™ gives turf a clean sweep and puts clippings in a truck or container.

It's HUSTLER tough
and built to last.

Introducing the Hi-Lift BAC-VAC™ attachment from HUSTLER. It's out to make a clean sweep in the grounds keeping industry.

Teamed with HUSTLER's 60-inch or 72-inch 3-Way Deck, the Hi-Lift BAC-VAC will quickly cut and vacuum your turf to perfection, and, just as perfectly, the Hi Lift BAC-VAC hydraulically raises 4.5 feet to easily deposit its 15-bushel capacity load into a container or the bed of a pickup truck. Plus, you do it all without ever leaving the operator's seat! In moments you're off mowing again.

The Hi-Lift BAC-VAC hopper stows behind the operator's position. This permits an unobstructed view out front and to both sides. It also permits the same close trimming capabilities HUSTLER is known for.

The HUSTLER Hi-Lift BAC-VAC attachment and drive-wheel steering saves time and labor costs, plus you cut more grass faster with a finer cut than any other mower in its class.

25 Years of Quality

The low profile design allows the Hi-Lift BAC-VAC to maneuver easily around trees and obstacles.

Pesticide defense feedback indicates shift in strategy

The reaction to our April Outlook, 'Safer Than Table Salt' Doesn't Work Any-more, has been rewarding. Manufacturers, distributors, and applicator groups have been supportive. They all share a very serious concern for pesticide liability if something isn't done to restore a trust in appropriate uses of pesticides. Each has promised investment in training and public relations.

But, more than anything else, the reaction shows our strategy for dealing with pesticide issues is changing.

It's hard to think offensively when we are regularly pounded by the general press as being sloppy, careless, and untrained. As Russel Weisensel, executive secretary of the Forestry/Rights-of-Way/Turf Coalition, puts it, "When anti-pesticide organizations hint that pesticide residues in our foods are slowly poisoning us and causing birth defects, and write articles stating herbicide exposure caused the amputation of a worker's leg, then references to table salt, shampoo, and other household products are needed to gain attention of our various audiences so that realistic assessments of benefits and risks are considered."

My point was, I'm not sure these comparisons do gain 'positive attention'. Instead, they give the average citizen the negative impression that he is more exposed than he thought to chemical threats upon his health.

Ray Russell, business manager for Dow Chemical's herbicide group, has spent millions of dollars and many weeks on the road defending herbicides. He admits his attitude has changed regarding pesticide defense.

"Pesticide issues are political, not scientific," Russell insists. "We can't fight political battles with lawyers and scientists. We must develop broad-based coalitions to show politicians there are people who believe in the need for pesticides and they are willing to publicly support them."

Russell adds two more reasons for adapting our defense of pesticides. The first is the anti-pesticide battle is less national and more local.

The second is the attack is against pesticides in general, not specific products. This makes a reasonable defense more difficult since the data on specific pesticides is much easier to present than a defense of all pesticides. After all, there have been mistakes and we can't hide from them.

The Environmental Protection Agency has made matters worse by deemphasizing the separation of restricted use from general use pesticides. Citing budget constraints, EPA has played into the hands of those wanting all substances more complex than baking soda banned from the market.

Weeds Trees & Turf in coming issues will feature organizations, not just talking, but acting.

**KEEP OUT OF REACH OF CHILDREN
WARNING**

**HARMFUL OR FATAL IF SWALLOWED
STATEMENT OF PRACTICAL TREATMENT**

If swallowed — Drink 1 or 2 glasses of water and induce vomiting by touching back of throat with finger. Do not induce vomiting or give anything by mouth to unconscious person. Get medical attention.

If inhaled — Remove patient to uncontaminated area. Keep patient strictly at rest and transfer to hospital immediately to get medical attention.

If on skin — Wash with soap and warm water.

If in eyes — Flush thoroughly with clean water.

NOTICE TO PHYSICIAN — Contains a cholinesterase inhibitor. Toxicity is not cumulative. It is a fast-acting insecticide. It is highly effective against a wide range of insects. It is highly effective against a wide range of insects.

An advanced carbamate insecticide that roots out and ruthlessly destroys white grubs, chinch bugs, sod webworms, mole crickets and other lawn and turf "terrorists". This tough operator doesn't get trapped in thatch, thus assuring positive grub control. TURCAM[®] is odorless...works well in spray equipment...won't damage turf or ornamentals. You'll find that TURCAM packs a federally-approved nationwide label, too.

Powerful reasons for assigning TURCAM to your toughest pest control problems.

For more information on TURCAM, including full labeling and recommendations for use, contact your local distributor or write to:

Rebel
TURF TYPE TALL FESCUE

vs. **KY-31**

There's really no comparison.

Test after test, year after year, REBEL continues to out-perform KY-31 and other tall fescues. Trials conducted in various parts of the country keep proving that only REBEL offers this important combination of advantages:

APPEARANCE - With REBEL you'll get up to 30% finer and 188% denser turf. Tests show REBEL's leaf width at 2.4mm while KY-31 measures 3.4mm. As far as density? REBEL shows 2,271 tillers per square foot against 789 for KY-31.

TOLERANCE - Tests show REBEL does exceptionally well under all weather conditions . . . wet,

sunny, shade, dry. In fact, REBEL is the most heat and drought tolerant cool-season turf grass available.

RESISTANCE - REBEL shows improved resistance to disease and insects.

LESS THATCH - REBEL produces virtually no thatch.

LESS CARE - REBEL requires less water and fertilization than most cool-season turf grasses.

For a finer, denser tall fescue that performs well in all types of conditions, use REBEL. Comparison tests continually prove that there's really no comparison!

Circle No. 124 on Reader Inquiry Card

From university test results REBEL has consistently demonstrated exceptional turf qualities.
