Penneagle crowds out bluegrasses on Butler National's fairways

Triplex fairway mowing at The Butler National Golf Club, Oak Brook, IL

When Oscar Miles, CGCS, of The Butler National Golf Club, introduced Penneagle creeping bentgrass into his *Poa annua* infested A-20 bluegrass fairways in 1980, he took a dynamic step toward the beautiful fairways praised by the pros during the Western Open.

Utilizing a prescribed program of aggressive, deep core aeration, drop seeding and verticutting, Penneagle was expected to aggressively compete with the bluegrasses. With triplex mowing and clipping removal, the unwanted grasses are yielding to Penneagle.

Oscar feels that his fairways are now 70-90% Penneagle.

With Butler National's reputation at stake, Oscar Miles couldn't chance anything less than Penneagle for his "immaculate" fairways.

Warren Bidwell is available to talk to your superintendents' group about Butler National Golf Course and the "Penn Pals," Penncross, Penneagle and Pennway Blend, on your golf course. Call or write TEE-2-GREEN Corp. for details.

18 COVER STORY: SAFETY TO THE MAX

More and more, athletic turf managers must know how hard their fields are. In this issue, we examine how to accurately measure the safety of fields. This test, though technical, may help avoid a lawsuit.

30 THREE STRIKES, YOU'RE OUT

A Landscape Management survey paints a bleak picture for athletic field managers. But some innovative managers are changing the scene.

34 AQUATIC WEED CONTROL

Use of aquatic herbicides is just one of five means of controlling water weeds. But three cooperative extension agents in Florida think it offers advantages the others don't.

44 ATHLETIC FIELD PROFILES

Those in charge of maintaining athletic fields at the high school level have problems their counterparts at colleges and in the pros don't. Here's how some of those problems are solved.

44 AN OLD MASTER

49 THE ONLY GAME IN TOWN

54 RESOURCEFUL RENOVATION

58 TRACKING TRACTORS

Selecting the appropriate tractor is an important purchasing decision. Here are some things to look for before making the big purchase.

66 BUSINESS MANAGEMENT

Purchasing . . . for price, performance and profitability . . . is not an easy task. Rudd McGary and Ed Wandtke discuss why.

A HARCOURT BRACE JOVANOVIICH PUBLICATION

It's easy to spot reel quality

Tear off a corner of this page. Now, use a scissors to cut off the other corner. Notice a difference? It's the same difference you'll spot when comparing turf cut by reel versus rotary mowers.

Reel mowers cut grass like a scissors cuts paper. Cleanly. There's less bruising of the grass plant so your turf looks better.

John Deere has four new reel mowers that give your fine turf this lush look. All four are hydraulically driven to deliver better quality cuts in long grass, wet conditions, or over contoured terrain. Places where ground-driven reels fall short.

The 303 and 305 are 3- and 5-gang pull-behind units. Both feature 30-inch floating cutting heads that mow down to $\frac{3}{8}$ -inch and are available in 4-, 6-, 8-, and 10-blade versions.

The 756 and 856 mount the same 30-inch reels on hydrostatic-drive John Deere traction units. Individual control of left, right and rear reels makes them perfect for areas where mowing around obstacles is a must. And, by simply removing the rear reel, both high-torque traction units can power other implements if needed.

For the name of your nearest dealer, or a free folder on all of John Deere's Golf and Turf Equipment call 800/447-9126 toll free (800/322-6796 in Illinois) or write John Deere, Dept. 956, Moline, IL 61265.

The 20-hp 756 and 24-hp 856 Turf Mowers deliver a quality 86-inch cut with individually controlled left, right, and rear reels.

Like all John Deere reel mowers, the 305 Gang Mower uses hydraulically-driven reels that work better in long grass, wet conditions, or over contoured terrain.

PGR market belies product name

■ Growth in the Plant Growth Regulator (PGR) market recently has been anything but regulated, or slow.

PGRs work by inhibiting seed head development on plants while still encouraging leaf development and growth, a scenario that often keeps turf green well into the hot summer months.

Products such as PBI/Gordon's Embark and Monsanto's Limit have been helping to reduce mowing frequency and cost in many areas of the green industry, especially rights-of-way. "Application of Embark," says PBI/Gordon product manager Earl Tracy, "prevents the need to mow for six to eight weeks."

And with costs in every area of turf care continuing to rise, a money saver is almost certain to become popular.

Survey says landscaping growth will continue

■ The 12th annual economic survey by the National Landscaping Association indicates that a majority of respondents believe the landscaping industry will continue to grow, most notably in residential landscaping.

For 1986, 70 percent of respondents reported increased sales in residential landscaping; residential renovation was up 61 percent; 65 percent reported increases in new commercial landscaping; just 33 percent reported increases in commercial renovation (53 percent showed no change).

When asked to forecast for 1987, 60 percent anticipated increases in new residential, 45 percent in new commercial.

On the whole, respondents' business increased an average of 21.7 percent from 1985 to 1986, well above the 16.8 percent forecasted at the beginning of 1986. Respondents are predicting an increase of 16.5 percent from 1986 to 1987.

California a model for other state regulators?

■ It seems that California's enactment of Proposition 65 "toxics initiative" is setting off a string of potential regulations in at least 15 other states nationwide.

Carl Pope, co-author of the proposition and a Sierra Club member, says that he and Environmental Defense Fund leader David Roe are penning a "generic" model of Prop. 65 for use by other states.

"This is not something that is being pushed out of California," Pope notes. "We are getting questions from everywhere." Pope claims he has received inquiries from a number of states concerning pesticide regulation. Washington, D.C. based National Campaign Against Toxic Hazards is working to set up legislation campaigns in 15 states.

Prop. 65 and proposed legislation in other states are similar. But "these new ones will go further," says Toxic Hazards' John O'Conner.

DEEP DOWN TURF PROTECTION WITH

TURCAM[®]

INSECTICIDE

NOW AVAILABLE IN
NEW GRANULAR
FORMULATION

Now you have two choices—TURCAM[®] WP liquid or new TURCAM[®] 2 1/2 G granular. Whatever your choice, TURCAM's advanced carbamate chemistry goes right to work knocking down white grubs, mole crickets, chinch bugs, sod webworms and many other destructive pests. TURCAM's federally-approved nationwide label provides these positive benefits...

- Fast action
- Good residual
- Doesn't tie up in thatch
- Easy to apply (liquid or granular)
- Cost-effective
- Odorless
- Doesn't damage turf or ornamentals

Powerful reasons for assigning TURCAM to your toughest turf pest control problems. For more information on TURCAM, including full labeling and recommendations for use, contact your local distributor or write to...

ATHLETIC TURF

Toronto decides to go with artificial turf

Despite a strong push by grass backers, the Toronto Stadium Corp. has chosen to use an artificial surface in its new dome stadium. The Toronto dome will be the first in North America with a retractable roof.

Because of the roof's retractability, turf scientists agree that growing turf inside a dome is possible. Jim Watson, Ph.D., vice president of the Toro Co.; Bill Daniel, Ph.D., inventor of Prescription Athletic Turf (PAT); and Steve Wightman, sports turf manager of Denver's Mile High Stadium, addressed grass supporters and the Toronto Blue Jays' management earlier this year in Toronto.

The Stadium Corp. chose artificial turf despite a strong public support for grass. The *Toronto Star* asked readers to vote on the two surfaces. The results showed 4,515 people in favor of natural grass to 34 in favor of synthetic.

A confidential report by the Stadium Corp. stated that they chose artificial because:

- "To grow grass require a daily minimum of 50 percent of available daylight. This represents approximately, on average, six to eight hours of light per day."

- "The grass may not be able to withstand and recover from a series of back-to-back baseball and football games."

- "The natural grass systems require that the stadium not be used for other purposes immediately following the football season when time is required to remove the turf, and before the baseball season when time is required for resodding. There would be a minimum loss of a potential 25 revenue-generating days/year with a P.A.T.-type natural turf system. This would result in a projected loss over the first 14 years of approximately \$8.7 million."

- "The estimated cost premium of natural vs. artificial turf over the first 14 years of stadium use is approximately \$22 million."

- Plywood or another similar material must be placed over the natural grass to mount most non-sporting events. In the opinion of trade show experts, this would render this project a "second-class trade show facility" and would completely undermine its ability to attract world-class events.

- "There are major operational risks in installing a natural grass system in the Dome stadium. Such an installation would be unprecedented and there are no assurances that the grass would be in a suitable condition for opening baseball games. As no satisfactory warranties or guarantees are available, the Stadium Corporation would be required to assume the full risk for the major liabilities involved."

The testimony of Watson, Daniel and Wightman disputed many of the claims. Lighting depends not only on duration, but intensity of light. PAT marketers say turf would fare well with 35 hours of light per week.

Wightman can convert Mile High from baseball to football in 13½ hours. "We have overnight versatility and yet we have not sacrificed the safety and playability of the field," Wightman said.

Cost is another matter of interpretation. The Stadium Corp. included in its figures a 12-acre nursery at a cost of \$700,000. Sod could be grown at existing sod farms or nurseries and brought into the stadium.

Also, a new study by Robert Baade, a Lake Forest (Ill.) College economics professor, says that new stadiums produce few financial benefits for communities. Instead they "realign" economic growth.

Despite a vote of 4,515 to 34 by *Toronto Star* readers, the Toronto Stadium Corp. will put in artificial turf.

SEED

New bluegrasses replace two old Scotts' varieties

Two new varieties of Kentucky bluegrass developed by O.M. Scott & Sons—Coventry and Abbey—will begin replacing Bristol and Victa varieties, respectively, this year.

Coventry, under development since 1970, is an improved variety made from a cross of Gnome and an unreleased Scotts selection. In Scotts' tests, it has shown good shade tolerance and disease resistance. It will replace Bristol, introduced in 1976.

Abbey, developed at the company's Marysville, Ohio, research site, is adapted for both sun and

shade. It can be used in a wide range of geographic locations. Abbey replaces Victa, a patented variety introduced in 1973.

Other recent seed introductions from Scotts include Ovation perennial ryegrass and Chesapeake tall fescue. Ovation, developed by Momersteeg International in Holland, was a top performer in recent national winter overseeding trials. Chesapeake, developed from four clones, three of which originated in Atlanta, has shown excellent heat and drought tolerance in Scotts' tests, lowering irrigation needs.

RESEARCH

A healthy lawn works like a sponge

The thicker the lawn, the more water it absorbs, according to research done by Penn State University turfgrass professor Thomas L. Watschke, Ph.D.

This absorption ability helps chemicals do their job, Watschke says.

"High quality turfgrass sites significantly reduce the total runoff," Watschke says. After more than a year's testing, sodded plots had 15 times less runoff than seeded ones. "This indicates that the surface soil structural effects (on seeded surfaces)

do not correct themselves quickly," Watschke notes.

The 1,300-square-foot plots were so sponge-like that even under three-inch-per-hour simulated rainfall, not more than a half-gallon a minute came off the plots.

Watschke added that thatch or a large-pored layer of decaying grass on top of the soil provided a buffer to the "infiltration rate characteristics of the underlying soil," helping to reduce runoff.

LAWN CARE

Is chemical lawn care a risk to pets?

It's not uncommon to hear of bird kills from the misapplication of pesticides. But such negligence can also kill larger animals such as dogs and cats.

Dennis Blodgett, D.V.M., Ph.D., of Virginia Tech, says it's rare, but possible to kill animals with lawn chemicals. "In reality, if you dilute and apply chemicals correctly, you won't cause a problem," Blodgett says. "Walking through a yard, the animal won't pick up much because of the footpads."

Birds are more frequently poisoned because they mistake chemical granules for seeds, Blodgett says. Eating a grub killed by an insecticide

won't cause a problem.

Dogs and cats are hurt by chemicals when the true cholinesterase enzyme in the nervous tissue is deactivated. The enzyme, which is also found in humans, acts on insecticides in the body and the activity drops off. Organophosphates and carbamates can inhibit cholinesterase in the nervous systems.

Cholinesterase will regenerate in the body, but when regeneration is slower than exposure, the animal is in trouble.

Owners often expose their animals
continued on page 8

1-2-3

The first time pesticide users actually come in contact with pesticides is at mixing. Therefore, caution must be exercised right at the outset to ensure caution against possible accident situations.

Four steps to mixing safety are pointed out by Bert L. Bohmont of Colorado State University in his book "The New Pesticide User's Guide." They are:

1. Always read the label and be careful to properly dilute the pesticide. Make sure you're working with the proper equipment, that you're wearing protective clothing, and that first aid equipment is available.

2. When handling hazardous pesticides, never work alone.

3. Be sure to mix chemicals in an outdoor or well-ventilated location. Do not position your body over the seal or the pouring spout. Never tear open bags; under certain conditions, dusts and powders can billow up in large concentrations.

4. All quantities of the active ingredient should be measured accurately. Measuring containers and weighing scales should be kept where mixing is done. Measuring containers should be thoroughly washed and rinsed after each use.

"The New Pesticide User's Guide" is available through Reston Publishing, 11480 Sunset Hills Rd., Reston, VA, 22090.

New Musser directors

New directors of the Musser International Turfgrass Foundation, gathered at the GCSAA show in Phoenix earlier this year, are shown above. Left to right, they are Mike Bavier, CGCS, Illinois; Peter McMaugh, Australian turfgrass specialist; and Tom Burrows, CGCS, Florida.

"1-2-3" is a monthly department devoted to handling pesticides "by the numbers."

to chemicals with flea collars, flea dips and injections. But a lawn care chemical could push the animal over the limit.

"As a lawn care person, you could spray and decrease the animal's cholinesterase level only 10 or 15 percent, but you could be the culprit and you'll get blamed for everything," Blodgett warns.

If this happens, Blodgett says the lawn care worker needs to find out how much the owner exposed the animal to other chemicals.

Cats are more susceptible than dogs to chemicals because of their grooming habits and because the enzymes in the body don't handle insecticides as well as dogs.

Problems rarely occur from a normal lawn treatment. The only real problems happen with an incorrect dilution which causes run-off into puddles that the animal drinks from.

To avoid animal poisoning, Blodgett recommends:

- Never apply pesticides if pets are in the yard. Simply refuse.
- Tell the client to keep pets out of the yard until the application is dry.
- Empty and turn over all feeding bowls, water dishes and bird baths.
- Water in granules thoroughly.

- Avoid the creation of run-off puddles.

- Avoid application of insecticide formulations near bird feeders.

You can tell if a pet is poisoned by symptoms such as vomiting, diarrhea, tearing eyes, constricted pupils, salivation, difficult breathing and uncoordination. Symptoms must occur within 24 hours of a lawn treatment to be related. If a poisoning occurs:

- Call a vet and/or poison control center. An injectable drug may be necessary.

- If the vet is not available, and the pet was exposed through the skin, bathe the animal in soap and water immediately. Rinse thoroughly. Be sure to wear protective gloves and an apron.

If the animal ingested the toxin, give it water or milk mixed with one teaspoon to two tablespoons of three percent hydrogen peroxide. Dosage depends on the animal's size. Do not use this treatment in severely depressed animals. Do not use if ingestion is past two hours.

You can also give a dog activated charcoal which can be bought over the counter. Always go by the children's dose on the bottle.

Blodgett spoke at the Landscape Expo in Chicago, Ill.

PARKS

Vandalism a problem for park managers

Jeff Bourne, chief of the parks bureau of the Howard County Department of Recreation and Parks, really knew how to get the people attending his vandalism session at the Landscape Exposition worked up. He just asked them what vandalism problems they had. Bourne did not have to say much after that.

The problems included graffiti, widespread trash, missing signs and a number of other annoyances. But what the vandalism caused most was frustration. "People won't use the park if it isn't looking good," commented one attendee. "(The vandals') presence inhibits attendance at the park."

One attendee, who's company does landscaping for a housing development, noted that because of vandalism, when he requested funding for more shrubs, he got an answer like "What's the point? They're going to be torn up anyway."

His solution has been to charge res-

NISSAN STANDARD REGULAR BED

HIRE A TOUGH WORKER THAT CAN PUT IN LONG HOURS, CARRY A HEAVY LOAD AND WON'T COMPLAIN.

How much do you have to spend to get a hard-working truck? One that can measure up to just about any job? One that can hold your maintenance costs way down?

Very little.

The Standard Regular Bed is Nissan's least expensive Hardbody Truck, yet it still delivers

outstanding ruggedness

and reliability that you can count on day after day. For instance, there's increased corrosion protection to help keep this Hardbody Truck strong. And the cargo bed features double-steel walls along with a payload capacity of up to 1000 pounds. There's also a truckload of additional standard features, including a powerful, fuel-injected, 2.4-liter,

twin-spark, hemi-head engine to help you tackle the tough jobs and a big, 104.3-inch wheelbase for improved stability. Plus, the roomy cab and three-across seating make it convenient to carry both passengers and equipment. Put it all together and you've got a tough worker and a tremendous value you'd be really hard put to beat.

For more fleet information see your local Nissan dealer today or contact our National Fleet Sales Department at Nissan Motor Corporation in U.S.A., 18501 South Figueroa, P.O. Box 191, Gardena, CA 90247.

The Nissan Standard Regular Bed. It's a tough worker that won't cost you a lot of money. The quality is great. The name is Nissan.

FOR VALUE AND TOUGHNESS
THE NAME IS NISSAN

SHORT CUTS

GOOD ADVICE.....Information on turfgrass management is available to turf care professionals who enroll in the Total Turf Management Program sponsored by Nor-Am Chemical Co. Professionals eligible to enroll include golf course superintendents, turf extension specialists and university personnel with turf programs.

Managers who sign up for the Nor-Am program receive four booklets on various aspects of turf management and reports published throughout the year. Booklets include information on disease control, fertilization, insect control and a calendar guide for turf management. To enroll, contact a local Nor-Am sales representative or write to: Communications Department, Nor-Am Chemical Company, P.O. Box 7495, Wilmington, DE 19803.

ENTER SOON.....Entry deadlines are approaching for three landscaping contests. The 18th Annual ALCA Environmental Awards Program deadline is Sept. 1, 1987. A new category, "Special Event," has been added to this year's competition. For information, contact ALCA at 405 N. Washington St., Falls Church, VA 22046 or call (703) 241-4004.

Deadline for the Florida Nurserymen and Growers Association Landscape Awards Program is June 29. Information on the awards can be obtained from FNGA, 5401 Kirkman Rd., Suite 650, Orlando, FL 32819; (305) 345-8137.

Deadline for the 1987 Amateur Residential Landscaping Competition, a new program sponsored by the National Association of Brick Distributors and the American Society of Landscape Architects, is July 1. Toro will supply prizes for the contest open to homeowners. Complete information and entry forms may be obtained by writing Landscape Contest, Suite 210, 1825 K Street, N.W., Washington, DC 20006, or calling (800) 432-3247.

CRANK ADS..... A new California state bill allows for disconnecting phones of unlicensed contractors who illegally advertise in alphabetical or classified directories published by a telephone corporation. The Contractors State Licensing Board (CSLB) can issue a citation with an order of correction requiring violators to end unlawful advertising and to disconnect phone service to the number displayed in the ad. The California Landscape Contractors Association is encouraging licensed contractors to file complaints against unlawful advertisers. Complaints should be filed with CSLB at P.O. Box 26000, Sacramento, CA 95826.

STRIKE UP THE BAND...Is high school band practice putting excess stress on your football field? Paint lines on the parking lot, says Philadelphia County extension agent Andy McNitt. "They have to have the lines to march," McNitt says. "But if they practice in the parking lot, it can save compaction and wear on the field."

YOU CAN TRUST RODEO® TO KEEP YOUR WATER SYSTEMS FREE OF MOST WEEDS. WITHOUT DRAINING YOUR BUDGET.

Rodeo® herbicide controls more than 90 emerged grasses, broadleaf weeds and brush—for a fraction of the cost of mechanical control. And unlike contact herbicides that simply knock weeds down, Rodeo controls or destroys whole plants—roots and all. So you don't have to come back time after time for the same weeds.

Rodeo is essentially non-toxic to people, animals and fish. It won't leach into non-target areas because it has no residual activity.

You can use Rodeo in flowing or standing water in most aquatic sites, including ditches, canals, lakes, rivers, streams and ponds.

Effective, environmentally-sound and economical Rodeo for broad spectrum aquatic weed control. Is there really any other choice that makes so much sense?

The Yamaha Terrapro work be

Along with sweating, sore limbs and painfully long days.

Introducing the Yamaha Terrapro™. The first ATV with something extra behind it. A rear-mounted PTO.

Or to be more specific, an ASAE standard, 1-inch, 2,000 rpm PTO which oper-

off your workday.

The Yamaha finish mower has three high-lift cutting blades that slice a full 48-inch swath over lawns, golf courses and grounds.

The Yamaha 42-inch rough-cut mower has an all-purpose rotary cutter that

eats up grass, weeds and light brush. It has high-lift rotary blades and side discharge which keeps the mower clear for a better, faster cut.

Both mowers have an adjust-

able mowing height of 1.5 to 5 inches that you set without needing any tools except your hands.

And because the blades are forged from tough, heat-treated steel, they'll last

This is the PTO behind the ATV. It helps you get your work done ASAP.

until the cows come home.

For spraying fertilizers, insecticides, herbicides, fungicides* or other kinds of industrial liquids, there's the Terrapro System of sprayers made for Yamaha by Broyhill.

They come in 50 and 100 gallon sizes with a versatile hand-held sprayer that lets you get at those hard to

The Yamaha sprayer with boom will help eliminate insects, fungi, weeds and long days.

ates a variety of mowers and sprayers.

For example, our exclusive Terrapro System of mowers designed for Yamaha by Woods. They trim hours

With the Terrapro hand-held sprayer you can spray anything from crops to cattle.

•Warning: Use of certain chemicals may cause injury and property damage. Read sprayer owner's manual and follow chemical label directions.

180 day limited warranty includes Terrapro and Yamaha mowers and sprayers. Warranty terms are limited. See your Yamaha dealer for details. Dress properly for your ride with a helmet, eye protection, long sleeved shirt, long trousers, gloves and boots. Designed for off-road, operator use only. This product is to be used by one person only.

PTO. It puts all your hind you.

The Yamaha Terrapro PTO is an ASAE standard, 1-inch, 2,000 rpm. Translated, that means it's really versatile.

INDUSTRY NEWS from page 8

idents at the development for the repairs if they are caught. Usually it is one of the children doing the damage. Bourne's statistics bear this out. The age group most responsible for the damage is the 17-22 year old, mostly in the lower end. And the damage takes away both time and money (about one or two percent of an annual budget) from the landscapers.

"It's a crime," said Bourne. "Criminal activity of a segment of the population that uses our facilities, and it should be treated as a crime." Bourne suggested getting offenders to do community service work in repairing the damage. "Try to get the kids to devote energy to other projects," he explains. A personal interest in the appearance of the park will make the kid less likely to vandalize again.

An attendee from a university said proper planning could reduce vandalism and general destruction. For colleges, he suggesting using large walks, and where shrubs were destroyed by traffic, using Washington Hawthorne as a sharp deterrent to traffic.

For more on park upkeep, watch for the October issue of *LANDSCAPE MANAGEMENT*.

PEOPLE

Woman super makes the books in Ohio

When WEEDS TREES & TURF ran an article on women golf course superintendents last December, we received a number of letters from women who had been overlooked. One woman, Jean Esposito, ran Hinkley Hills, a public course right down the road from our offices.

Now Esposito has made Ohio golf history by becoming the first woman president of the Northern Ohio GCSAA chapter. The chapter of 270 (only two members are women) elected Esposito vice president last November. She became president when the previous president took a job in California.

Esposito's parents Donald and Beatrice Krush built the course on a family farm in 1964. It is still a family-run business. Esposito's husband works as her assistant, while her sister manages the clubhouse.

CONFERENCES

Expo plans to draw 20,000 attendees

The fourth annual International

Lawn, Garden & Power Equipment Expo next month will draw more than 20,000 participants, according to the public relations agency handling the event.

Almost 260,000 square feet of exhibition space has been sold for the Expo, to be held in Louisville, Ky., July 27-29. Thirteen football fields would not fill that much space.

Howard K. Smith, one of America's most distinguished broadcasters, will be headline speaker. Singer Wayne Newton, a top Las Vegas entertainer, will also give a performance.

For more information, call (800) 558-8767. (In Kentucky or outside the continental U.S., call (502) 582-1627.)

For your award-winning project to be included in "On Design" send color slides and a description of the project to:

Surflan. Roundup. Mix them together, and you've got control that knocks weeds down and keeps them down. Three times longer, in fact, than Roundup alone.

That's what landscapers all across the country are now finding. They are getting better weed control and more satisfied customers. And they're saving time and labor costs because they're applying just once.

With a Surflan/Roundup tank-mix, you get complete control of over 50 different weeds—including such tough species as crabgrass, barnyardgrass, chickweed, spurge, johnsongrass and

foxtail. And Surflan won't harm your nearby landscaped areas, either. It works with little or no lateral movement.

Join the growing list of satisfied users. Add Surflan to your Roundup and stretch your weed control three times longer. See your Elanco distributor for Surflan. Or call toll-free: 1-800-ELANPRO. In Indiana, call collect: 317-261-6102.

SAFETY TO THE MAX

In September 1986, WEEDS TREES & TURF exclusively reported the story of a college baseball player's death on a synthetic field. The case raised questions which apply to the natural turf industry. In this issue we examine how to accurately measure the safety of fields. This test, although technical, may help you avoid a lawsuit.

by Heide Aungst, managing editor

Editor's note: Scott Halbrook was a 19-year-old freshman on a baseball scholarship at Oregon State University in Corvallis. On March 2, 1982, Oregon's rainy weather forced the team away from the natural practice field onto the AstroTurf football field at Parker Stadium.

Scott, playing left field, collided with the shortstop while running for a short pop fly. The collision knocked Scott backwards. His head hit the AstroTurf. He never regained consciousness.

Anonymous phone calls about the poor conditions of the field prompted Scott's family to hire attorney Dan Holland of Eugene. The Halbrooks filed suit against AstroTurf manufacturer Monsanto, Sports Install Inc. a subsidiary of Monsanto and Oregon State University. The parties settled out of court in September 1985.

The story of Scott Halbrook's death on a college athletic field sent shivers down the spines of field managers throughout the country.

Some natural turf managers shrugged it off since the death occurred on a synthetic surface. Others immediately recognized the ramifications that such a report could have on the natural turf industry.

Natural turf researchers had been looking at making fields safer for several years before the Halbrook case reached the public. But by speaking out, attorney Dan Holland and Scott's father Alan Halbrook got others to recognize that field safety should be a universal concern, not one confined to the artificial turf industry.

This new-found awareness, combined with the liability crisis threatening to doom school athletic programs, has sent scientists in search of practical measurements to set guidelines for field safety.

Setting a standard

The place to start in setting a standard, say researchers, is to look at what already exists. The American Society of Testing Materials (ASTM) has set a test standard (F-355) for measuring the hardness of surfaces. ASTM defines their test method as *the measurement of certain shock-absorbing characteristics, the impact force-time relationships, and the rebound properties of playing surface systems.*

The standard further states, "this test method is applicable to natural and artificial playing surface systems and to components thereof." Although three procedures exist for

GLOSSARY

The following is a glossary of terms used in the measurement of hardness:

Acceleration: The instantaneous time rate of change of velocity which may be positive or negative.

G: The ratio of the magnitude of missile acceleration of gravity, expressed in same units.

G-max: The maximum value of G encountered during impact.

Severity Index: An arbitrary parameter equal to the integral of $G^{2.5}$ times distance times time over the total duration of impact.

doing the test, the most common used on sport surfaces is Procedure A, which uses a cylindrical 20 lb. missile with a 20-inch circular flat metal face.

The problem is that most natural field managers have never heard of the test standard or the terminology used in determining hardness levels. Those natural field managers who are aware of the ASTM test may have learned the hard way.

"The only time I've tested a natural field is when there's a lawsuit," says Dick Schefsky, with Northwest Laboratories in Seattle, Wash. "We test artificial turf all the time. We can use the same equipment to test natural turf."

Dissecting the test

Before field managers can truly understand the importance of cultural practices, such as aerating and mowing, they must understand the basic principals of shock absorbcancy properties on playing surfaces, and the test which determines this. Schefsky says it's important to know this not just for football players, but for cheerleaders and other sports participants who may fall unprotected onto the surface.

DROP TEST

Figure 2: Impact pulse from one drop

Figure 1: An optical detector triggers the scope. The acquired signal is then fed to the floppy disk and an X-Y recorder for permanent storage.

"The deceleration of a falling body that impacts on a surface is one measure of impact absorption," says Don Waddington, Ph.D., soil scientist at Penn State University. "A hard rigid surface would stop the falling body quickly and would absorb little of the energy upon impact. A softer surface has a lower peak deceleration and absorbs more of the energy."

Perhaps a simpler way to understand the test is to imagine holding your arm out stiff and having a baseball thrown at it. If you don't move your arm as the ball hits it, it will sting. But if you move your arm and stop it back by your ear, the hit won't seem as hard because you're actually slowing down the stopping action over a longer period of time.

Not moving your arm simulates a hard surface with a high G-max. Moving your arm represents a softer surface, with a lower G-max.

The ASTM test is done by impacting the surface at a specified velocity with a missile of given mass and geometry. An accelerometer mounted in the missile monitors the acceleration. An accelerometer is a device which produces a voltage proportional to the acceleration it senses. Northwest uses an accelerometer from Vibro-meter Corp. of Billerica, Mass.

The acceleration of the impact is recorded with the aid of an instrument called an oscilloscope, that is an electronic instrument, like a television screen, which gives a visible trace of the voltage vs. time.

When Northwest Labs perform the test, they drop the missile at three different locations on the field. The drop test instrument includes the missile that has an accelerometer attached to it. An electrical signal emitted from the accelerometer is a measure of the deceleration of a missile when it impacts the surface.

The missile falls past an infra-red photoelectric eye. This optical detector and the accelerometer are hooked into an oscilloscope. A recorder attached to the oscilloscope will record the pulse of the drops (see diagram).

This pulse forms a bell-shaped curve. The points on this curve are Gs (gravities). One G equals the acceleration due to gravity. The peak of this curve is called the G-max. The

G-max is what's looked at as the hardness level.

Another example Schefsky uses to explain the test in simple terms is to drop a ball bearing on a piece of steel. The ball bearing will bounce straight up because the surface won't absorb the shock. But if you drop the ball bearing on a pillow, it won't bounce because the soft surface absorbs the shock. The first example would have a high G-max reading. The second would have a lower G-max reading.

After taking the readings in the field, Northwest Labs plugs them into a computer program which reads out the actual deceleration rate. The sophisticated digital oscilloscope (Nicolet Instrument Corp, Madison, Wisc., Model 3091) which Northwest uses, allows them to keep the field readings on a "bubble memory cassette" to be re-examined in the lab.

The price of such equipment, approximately \$5,300 for a digital oscilloscope and about \$500 for an accelerometer, puts it out of the range of most school systems. The cost of purchasing such equipment must also include the guide system, fabrication of a missile, and a recording system. A computer and software program to figure the acceleration is also necessary.

The test and lawsuits

An independent lab can do the testing much cheaper than buying the equipment. Testing fields regularly at a low cost and correcting hardness problems could help school systems avoid major lawsuits and obtain insurance more easily.

"It's desirable to get a third party to do the test," Schefsky says. "I have no stake in the outcome. Third party testing lends credibility for insurance or legal purposes."

Schefsky says Northwest Labs is the only independent lab that he knows of with a portable system. Northwest's specialists will go anywhere in the country for \$575 plus travel expenses.

"You have to put it into the budget," Schefsky says. "But if somebody does get injured, at least you will not have been remiss."

continued on page 20

SAFETY from page 19

Natural turf's impact

Penn State University, which in 1984 published the first solid research correlating sports injuries with field conditions, is taking such known technology and applying it to the special considerations of natural turf.

"Many people are interested in what constitutes a hard or soft field," Waddington says. "We want to know too, but at the same time we are trying to answer these questions we are also trying to develop a good method for evaluating surfaces."

Trey Rogers, a doctoral candidate at Penn State, is working on developing a portable system to measure impact absorption characteristics in the field. He has been using a Clegg impact tester from LaFayette Instruments in Lafayette, Ind. The Clegg impactor comes with an accelerometer. He attaches this to a portable vibration analyzer (Bruel & Kjaer type 2515), which has an oscilloscope that displays the impact curve. Up to 50 impacts can be stored on the analyzer before unloading into a computer for analysis.

Rogers has made some of his own modifications in the

instrument. "The Clegg uses a 10 pound weight. I don't think that gives an accurate portrayal of a person falling," Rogers says. "I use a five-pound weight with a 3.14 square inch surface on the missile. Theoretically we selected the missile to obtain the same impact energy per square inch as with the ASTM method." His data on athletic fields have shown that surfaces were harder inside the hash marks on football fields. His measurements last spring showed that frost heaving of soil can lower these differences.

Rogers has established research plots to study the effects of compaction, core cultivation, mowing height, vegetation and roots on impact absorption. On these plots he uses three different weights which influence results depending on the weight of the hammer.

The light-weight hammer is often used in foreign studies to simulate the ball bounce. The heavier hammer correlates the impact of an athlete running or falling on the surface.

Critics argue that natural turf's hardness level changes whether it's wet or dry. "You can still find out what the

POP QUIZ

1. WHAT DO YOU CALL A TALL FESCUE THAT LOOKS LIKE BLUEGRASS?

KENFESCUE
BLUEGRASS

TALLTUCKY
GRASS

BLUE FESCUE

MUSTANG
TURF-TYPE TALL FESCUE

THAT'S RIGHT, Mustang turf-type tall fescue. Chances are, you already knew that, but did you know that professionals like you are choosing Mustang over K-31 and many other commercially available varieties?

You'll admire Mustang's beautiful bluegrass-like qualities; the finer leaf texture, rich dark green color and dense uniform turf.

Even more you'll appreciate Mustang's toughness and practicality. Its heat and drought tolerance, winter hardiness, and ability to endure low mowing heights are remarkable. Mustang even shows improved resistance to *Helminthosporium* net blotch and many other turf diseases. Plus, Mustang performs ex-

DROUGHT TOLERANCE AFTER SEVEN WEEKS NO RAINFALL.

tremely well under low maintenance conditions like minimum fertilization, watering and mowing.

You may know about Mustang already, but it's well worth repeating: For bluegrass beauty and tall fescue practicality there's nothing like Mustang turf-type tall fescue.

Pickseed also produces

and

and other fine turf grasses available nationwide from quality seed suppliers.

Here's why the best superintendents can't

1

NEW BANNER® GIVES YOU LONGER LASTING CONTROL OF DOLLAR SPOT AND BROWN PATCH.

You know how quickly fungus diseases can wreak havoc in your greens. Which is exactly why Banner's new systemic, longer-lasting chemistry for turf has been so eagerly awaited.

Because of its systemic action, one spraying of Banner lasts 14 to 21 days on brown patch. And provides up to 28 days of excellent control on dollar spot at a 2 oz. rate.

2

SYSTEMIC, PREVENTIVE CONTROL.

Now you can stop disease before it gets started. Banner works systemically to control disease from the inside out. Once Banner is quickly absorbed by the leaf and root system, it won't wash off. It keeps on working after drying, unaffected by rain or irrigation.

Banner also goes on to prevent powdery mildew, rust, anthracnose, red thread and stripe smut.

wait to put Banner on the spot.

3 LOW RATES, LOW COST PER DAY, FEWER SPRAYS.

Banner's new chemistry is so powerful, just 1 to 2 ounces per 1,000 square feet is all you need.

These low rates and long residual mean lower cost per day of control. Less chemical, low rates and long residual also mean Banner performs with fewer applications which makes Banner the preferred treatment where environmental considerations are important.

Put Banner on the spot. And get longer lasting, systemic control of dollar spot and brown patch.

SAFETY from page 20

optimal condition should be," Schefsky says. Rogers agrees that his research could lead into sports turf managers knowing what cultural practices to use, such as watering to soften the field.

What's safe?

ASTM has given labs and artificial turf manufacturers a standard to follow in performing tests. But they qualify the test with this statement: *This standard does not purport to address all of the safety problems associated with its use. It is the responsibility of the user of the standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

But what does it mean to the turf manager or player safety?

One major synthetic turf manufacturer has determined that G-max levels using a 20 lb. missile dropped from 24-inch height of "good grass" is about 75-100, while frozen earth is about 275. This manufacturer aims for the product to have a G-max of 200 using the 20 lb., 24-inch test.

Except for the current work by Rogers and Waddington,

Penn State University uses a Clegg impact tester and vibration analyzer with three different weights for their impact absorption research.

G-MAX VALUES

A major synthetic turf manufacturer has assigned these G-max values using F-355, to the following conditions:

Hard frozen earth/gravel	275
Hand-packed dry earth or "Normal" frozen soil	175-200
P.A.T. system	125-140
"Good" grass	75-100
Soggy, wet grass	70-75

no one in the natural turf industry has set G-max guidelines for natural fields.

"What are we talking about here?" Holland says. "What's safe? Do you fall from 24 inches or do you fall from your height?"

"It would be nice to write a specification and say 10Gs is safe," says Roger Schmidt, who's in research and development for Uniroyal and on the ASTM sports committee. "But it needs to be technically and logically feasible."

In a new standard which ASTM is proposing for playground surfaces, G-max levels will be taken at one foot intervals so that manufacturers can compare the values to the height of the equipment.

Still, Schmidt admits that G-max levels alone mean very little.

The severity index can better determine effects on player safety. "Instead of looking at just the maximum force, the severity index looks at a time interval of the force applied," explains Schmidt. "Severity index is more complicated to calculate and more related to head injury."

continued on page 26

An oscilloscope is an electronic instrument, like a television screen, which gives a visible trace of the voltage vs. time.

An accelerometer is a device which produces a voltage proportional to the acceleration it senses.

TOUGH / EASY

in the rough on the green

You get the best of both worlds with the New Holland LB-620. A tough, articulated loader/backhoe that's easy to operate in rough spots and tight spaces. And, a lightweight low-profile design, with a softer touch on turf.

Balanced design

The low-profile design distributes the weight over each drive wheel for full ground contact and a softer touch on turf. Positive four-wheel hydrostatic drive combines with four-way articulation to give you the flotation and traction you need in rough spots and soft spots, and adds extra stability on slopes and rough terrain.

With a tighter turning radius, and a lower profile, the LB-620 works in spaces that are too tight for other loader/backhoes.

Deep digging—high dumping

Powered by a 53-hp diesel engine, the backhoe has a

digging force of more than 10,000 pounds, and digs 11'-13'. The $\frac{5}{8}$ cubic-yard capacity loader moves into the load with a breakout force of 6,442 pounds. Dump height is more than nine feet.

Easy transport

The compact LB-620 makes job-to-job transport easier, too. You tow it on a trailer behind a one-ton pickup. Yes, the LB-620 takes on the toughest jobs—but works with a soft touch. Ask your New Holland dealer for a demonstration, or write to Ford New Holland, Inc., 500 Diller Ave., New Holland, PA 17557.

Severity index

Severity index takes into consideration the Gs as well as the time over which the force is applied.

"Studies show that a person can tolerate a hard surface for a short amount of time. That's usually figured in milliseconds," Schefsky explains. In other words, if the surface absorbs the shock of the impact quickly, then that surface may not be as "hard" to a human body as a surface which absorbs the impact slower. One surface with a G-max of 200 may have a higher severity index than another surface which peaks at 200Gs.

Most standards such as ASTM and the severity index are based on head injuries. Original tests in this area dealt with heads hitting automobile dashboards.

Some researchers went as far as dropping animals on surfaces and even cadavers. "What damage occurs in a cadaver's head may be undetectable, while it could produce a concussion in a human being," says Bruce Martin, Ph.D., of the biomechanical engineering department at the University of California at Davis. Martin, along with Dr. Douglas Bowers of West Virginia University Medical Center, com-

pleted perhaps the study most critical to the natural turf industry on impact absorption of natural vs. artificial surfaces.

The 1974 test showed that five-year-old synthetic turf was almost as hard as asphalt, while bluegrass sod provided a softer surface. Bowers had planned to re-do the test this year, but the field he had been testing was ripped out. His plans are currently on hold.

The future

Rogers' impact absorption research, along with the work of other turfgrass scientists on turf strength and cultural practices will have profound effect on the future of the athletic turf industry.

"There are many things it could do," Rogers says. "I think we'll start seeing more people in the athletic field service industry. It's cheaper for schools to hire out for services. I think we need this research for athletes and parents of kids at the high school and junior high school level."

"There are many variables to be considered," adds Waddington. "We don't have the resources to do everything at once, but we are making progress." **LM**

PRACTICE MAKES PERFECT

It's an ironic situation, but it happens at schools everywhere: athletes spend more time on practice fields, while turf managers spend more time on game fields.

In 1984, Penn State University researchers published the first study correlating field conditions with player injuries. The researchers found that more injuries happened on practice fields, and that turf managers work less on those fields.

Since the publication of that study, the hardness issue also has come to the forefront of athletic turf management. The two issues combined have given athletic field researchers a new perspective on field management. While natural turf managers need to be aware of "G-max" levels on game and practice fields, the actual turf surface also is a concern.

Rich Henderson, who completed a masters thesis at Penn State in August, looked at the impact absorption properties of various surfaces. "Rich laid the groundwork for my research," says Trey Rogers, a doctoral candidate at Penn State. "He did his research in the lab, while my system is portable."

Henderson's results show that the presence of bluegrass sod on clay and coarse sand soils made the surface softer, but had little effect on a silt loam soil. A turf cover of 60-day-old ryegrass on the silt loam was softer than bare soil. Core cultivation decreased surface hardness of a silt loam soil.

The drop-test instrument used to

Matt Leonard and Steve Cockerham look over the traffic simulator they created to produce wear on athletic field research plots.

measure impact absorption is not the only instrument which is important in evaluating turf strength.

Henderson also looked into the use of the pentrameter, a device which is pushed into the soil and measures the force per unit area.

Turf density, soil moisture and bulk density influenced the ease of pushing it into the soil. Turf density influenced a pentrameter with a 1.0 or 2.0 sq. cm. cone, while bulk density influenced a 0.25 or 0.50 sq. cm. cone. The 1.0 sq. cm. cone correlated best with soil moisture.

More research

Another problem researchers face is

simulating actual field conditions on research plots. In order to do this for athletic turf, Steve Cockerham, superintendent of ag operations at the University of California-Riverside developed a "traffic simulator."

Cockerham says the invention evolved from "25 to 30 ideas" from other researchers across the country.

"Visualize the center of a football field," Cockerham explains. "It's torn up and compacted. In trying to develop new grasses you have to duplicate the wear of a football player over a plot. You can't tell a turf manager what to do if we're evaluating turf under different conditions than he lives with."

NOW, THE FIRST NAME
IN FUNGICIDES IS
THE LAST WORD
IN CONVENIENCE.

INTRODUCING
NEW CHIPCO®
26019 FLO.

FUNGICIDE

The easy way to stop major
turf diseases for up to
four full weeks.

Thousands of golf course superintendents have discovered one important fact. You just can't beat Chipco 26019 fungicide for controlling turf diseases.

And now you can get all the advantages of Chipco 26019 wettable powder in a convenient flowable formulation. New Chipco 26019 FLO.

Like the wettable powder, new Chipco 26019 FLO offers unsurpassed protection against major turf diseases, including Helminthosporium Leaf Spot and Melting Out, Dollar Spot, Brown Patch, Fusarium Blight, Red Thread, Fusarium Patch, plus Gray and Pink Snow Molds.

Chipco 26019 FLO also delivers the same long-lasting residual control. In fact, both Chipco 26019 formulations protect your turf for up to 28 days.

With Chipco 26019, you also get the added benefits of convenience, no phytotoxicity, pesticide compatibility, low toxicity and no corrosiveness.

Wettable Powder or new FLO, it's easy to see why Chipco 26019 is the Number 1 name in turf disease control.

The machine consists of two steel rollers, one foot in diameter with cleats welded to the rollers and connected by bike chains. The rollers move at different speeds.

The traffic simulator hooks onto a Kubota tractor. It is run over plots at different rates to imitate different conditions.

Cockerham and his colleagues are testing a Bermudagrass plot built as a sand sports field; various cool-season species used to overseed Bermuda; and tall fescue which represents golf fairway turf.

They can then test cultural practices, such as irrigating and fertilizing, to tell which will give an athletic field manager a healthier field. Preliminary results show that *Poa trivialis* on common Bermuda wears out rapidly, while Caliente perennial ryegrass holds up to wear best.

"I don't think you can say whether hardness or shear strength is more important," says Rogers. "They both go hand-in-hand in developing a good surface."

The answers to athletic turf problems may be slow in coming, but new technology, such as accelerometers and oscilloscopes, pentrameters and the traffic simulator, will provide safer turf in the future.

Club Car's New Carryall II Will Out-Tough Any Utility Vehicle In The Field

Out-Perform Everything about the new Carryall II - the body, truck bed, power and drive train, accessories - has been designed with exclusive Club Car features to enhance performance, durability, reliability and safety. The Carryall II will out-perform competitors in every category.

Out-Haul With the largest pickup bed (50" x 50" x 11") and biggest gross payload (one-half ton) in the industry, plus a standard trailer hitch with a towing capacity of 1,000 lbs., the Carryall II becomes the most functional, practical and economical vehicle around.

Out-Last Club Car exclusives like the Rust-Free Aluminum Pickup Bed & Frame*, heavy duty front bumper and side rub rails and Double Wall Pickup Bed Construction* of lightweight durable aluminum allows for a longer, more productive life span.

Out-Pull Club Car's 4 Cycle/341cc Engine*, the largest in the industry, gives the Carryall II the power to haul ½ ton loads without stress and vibrations.

Out-Maneuver The Carryall II is designed to maneuver in tight aisles and small spaces with a clearance of 20' 8", the tightest in the industry.

*Carryall II Exclusive Features.

THREE STRIKES YOU'RE OUT!

A LANDSCAPE MANAGEMENT survey paints a bleak picture for athletic field managers. But some innovative managers are changing the scene.

by Heide Aungst, managing editor

Lack of community support, low budgets and over-scheduling fields are three strikes against even the best athletic field managers.

"When a field goes bad we receive negatives, but no support," says Bill Dunn, parks and recreation director in Medina, Ohio. "We're expected to have the fields in good shape."

"They just want an area to conduct their events," echoes Bob Marchesano, landscape grounds administrator at California State University in Long Beach.

Most of the field managers in a LANDSCAPE MANAGEMENT survey complained about minimal community support. But one had a different story to tell.

"It's excellent," says Harry Gross, parks director in St. Petersburg, Fla. "The leagues assist in renovations."

Gross is responsible for six acres at a softball complex, seven acres at a baseball complex and 21 acres of soccer fields. They are used about 9,300 hours year-round. "There is no off-season in Florida," Gross says.

Reviving renovations

Every five years, Gross and his crew of five for athletic fields (18 overall) completely renovate the Bermudagrass/sand fields. The renovation includes removing the existing turf, regrading the area and

sodding or sprigging. Cost is about \$12,500 to sod; \$7,000 to sprig.

Some respondents never renovated fields. Others renovate only when problems arise. Still others have regular renovation programs.

One respondent, Rod Perry, landscape supervisor at a community college in Marysville, Calif., renovates baseball fields every two years. He spends about \$5,000 to regrade, topdress, reseed and upgrade the drainage systems.

Every five years Perry renovates football fields for \$2,500; softball every two years for \$1,000; and track every five years for \$1,500.

He says his fields are used up to seven days a week, 10 months out of the year. His crew of three spends about 20 hours a week on the fields.

Henry Indyk, Ph.D., of Rutgers University has compiled some of the first statistics on field renovation (see table). A complete field excavation and replacement costs between \$167,000 and \$223,000. Indyk worked with consultants who reconstructed high school fields in New Jersey to get his figures.

Most field managers spend well below \$167,000 for field renovations, when they renovate at all. Indyk says he doesn't have figures for field maintenance.

Maintenance budgets varied

greatly among survey respondents. School budgets often included the surrounding landscape, while park budgets included everything from public cemeteries to roadsides. Respondents said it was difficult to break out figures for chemicals and equipment used solely on athletic fields. But the average annual budget among respondents—including labor, equipment and chemicals—was \$63,991.

Budgets seemed to correlate with community support. When support was low, so was the maintenance budget.

Injuries

Support from coaches and athletic staffs got a mixed review from respondents. Tom Rudberg, grounds supervisor at a college in St. Paul, Minn., says he feels coaches and athletic directors need information to understand the problems and procedures in maintaining and renovating fields.

"I now have the coaches and athletic director justify and budget for major work on athletic areas," Rudberg says. "If they don't like the condition of a field, then they are responsible to correct the problem. I am used as a consultant and estimator. If a project is approved, then I oversee it. If it is not approved, then it is not my problem, but the athletic director's. This makes the athletic department realize the total actual cost of their fields."

Doug Jacobs, superintendent of parks in Sterling, Ill. says his coaches point out areas which may cause injuries to players.

Most respondents agreed that ankle sprains and knee injuries are the most common natural field-related injury.

In order to prevent such injuries, managers perform a variety of cultural practices. "We aerate often in order to eliminate compaction," says Dunn. "Grass is mowed according to sport and weather conditions."

"We try to keep turf areas even and consistent," Marchesano says. "We have been replacing old brass heads with new plastic pop-up rotors."

"We have formal and informal inspections on a scheduled basis as part of the department of safety program," says Walter Stasavich,

superintendent of parks in Greenville, N.C.

A standard?

Respondents varied in their opinions of setting a standard for natural fields. "I would like to have a national non-profit organization (not government), research, develop, and promote standards," Stasavich says.

"I do not believe an effective determiner could be set up which would hold up in court," disagrees Gross.

"Ideally, yes, but it's not practical in our case," says Jack Cook, a high

school grounds foreman in Ferguson, Mo. "We have neither the time nor funds available to correct problems."

"Yes, it would reduce injuries and allow athlete's some consistency (practice fields vs. playing fields)," says Marchesano. "This could be done by possibly an egg drop test or some type of pressure compaction test."

Field management problems may vary between warm-season and cool-season turf areas and depending on the soil type, but most managers face the same challenges.

LM

FIELD COSTS: NATURAL vs. ARTIFICIAL

by Henry Indyk, Ph.D., Rutgers University

ESTIMATED FIELD COST BASED ON A 20-YEAR LOAN AT 12 PERCENT INTEREST.

Natural:

Principle:	\$250,000
Interest:	\$315,000
Total:	\$565,000
AVERAGE ANNUAL COST:	\$28,250

Synthetic:

Principle:	\$1 million
Interest:	\$1,260,000
Total:	\$2,260,000
AVERAGE ANNUAL COST:	\$113,000

(Editor's note: It's important to note that this is based on a 20-year loan . . . studies prove that artificial surfaces must be replaced after about five years.)

Synthetic field

TOTAL Estimated Cost: \$500,000 to \$1.5 million
This figure does not provide for internal drainage of the field.

Natural field*

*(A PAT system on a natural field costs an estimated \$750,000 to \$900,000)

The Green 300 lives lowest ex

Most greensmowers can live up to your highest expectations. But only the industry leader, the Greensmaster 300, can live up to your lowest.

No matter what your height of cut requirements are, the Greensmaster 300 measures up. Or measures down. That means cutting versatility from as low as 3/32" up to 11/16"! Just what you need to cut your greens to tournament standards and deliver a precision cut to aprons and tees as well. **New cutting units and Toro's Variable Speed Kit.**

NEW 5 and 11 blade cutting units.

The perfect combination for a precision cut.

What makes the precision cutting of the Greensmaster 300 possible? The correct choice of cutting blades for your desired height of cut. Our new 5 and 11 blade cutting units, and our proven 8 blade unit, give you the capacity to cover the entire height-of-cut range for the truest ball roll of all. This precision cutting is achievable

Single-hand bedknife adjustment knob.

in combination with Toro's exclusive Variable Speed Kit. It allows you to select a consistent ground speed while maintaining a constant, even clip.

Another exclusive feature for varying cutting conditions.

The Greensmaster 300 also features an exclusive cutting unit attitude leveling adjustment through its rear roller. This lets you set the correct attack angle of the bedknife for varying cutting conditions. **Additional cutting versatility at the flip of a handle.**

With Toro's quick height-of-

Greensmaster[®] up to your expectations.

cut kit you can easily change your height-of-cut to 5 different levels. Each flip of the handle alters the height-of-cut by .100 inch within a total range of 1/2" above the cutting unit bench setting.

For further versatility and productivity, Toro provides a full range of bedknives, rollers, combs and brushes. Plus options that include direct suspension, thatchers and spikers.

Put them all together and it's easy to see why more Golf Course Superintendents depend on the Greensmaster

Quick height-of-cut adjustment.

300 than any other riding greensmower in the world. And why you should, too. For precision cutting, only the Greensmaster 300 lives up to your lowest expectations. And in a profession like yours, that's the height of accomplishment.

AQUATIC WEED CONTROL

Use of aquatic herbicides is just one of five means of controlling water weeds. But three cooperative extension agents in Florida think it offers advantages the others don't.

There are five major means of aquatic weed control:

- by fertilization;
- by drawdown;
- with mechanical devices;
- with biological controls; and
- with chemical controls.

The following information was excerpted from "Weed Control in Aquaculture and Farm Ponds" by D.D. Thayer, W.T. Haller and J.C. Joyce of the Florida Cooperative Extension Service.

Fertilization

The theory behind a pond fertilization program is that phytoplankton (microscopic algae) populations increase as a result of the controlled addition of fertilizer nutrients until light penetration is reduced below the level required for growth of submersed weeds.

Before beginning a fertilization program for weed control, consider the following:

1) Once a fertilization program has begun, you must always continue the program or face possible severe weed problems.

2) Some weeds, such as hydrilla, have been shown in Florida to out-compete phytoplankton communities for nutrients, thereby making the weed problem worse. It is therefore imperative that fertilization should not be initiated until current weed infestations have been totally controlled.

3) If the fertilization of a pond is intended to be used to stimulate food production in an aquaculture pond, then additional weed control with herbicides or with weed-eating carp *Ctenopharyngodon idella* may be beneficial.

Most fertilization recommendations suggest adding inorganic fertilizer every two weeks until a shiny object placed 18 inches below the surface is no longer visible. Once this level of phytoplankton is obtained, maintain that level with pe-

An aquatic plant harvester clears weeds from the lake's surface.

riodic fertilization. The optimum pH should be at least 6.5 or higher, and liming may be required prior to fertilization.

The best time of year to begin a fertilization program is in the spring before aquatic weeds have begun to grow.

Drawdown

Water level fluctuation or pond draining can be used very effectively if the conditions are favorable. Exposing the bottom of the pond to the atmosphere will solidify suspended mud and consolidate bottom sediments to a watertight condition. Excessive nutrients suspended in the water column will be diluted as a result of the water exchange.

In order to have a successful drawdown, you must leave the water level down long enough to desiccate and kill submersed plants. An incomplete drawdown may have little to no effect, and some plant species that are not susceptible to drawdown may spread into the de-watered lake bottom more easily. Cattails are often opportunistic and may establish during extended drawdowns.

The consolidation of bottom muck by drying should also improve fish spawning and nursery areas. Drawdowns also increase options for chemical weed con-

trol. Some herbicides are only labeled for use on drained pond bottoms; treatments at this time often provide several years of weed control because the herbicides are bound in the bottom sediments.

Mechanical control

Mechanical control involves the physical harvesting of vegetation by hand or with specifically engineered equipment. For the owner of a small pond, mechanical control can be helpful for removing small populations of nuisance plants.

While the simplest mechanical harvesting devices are often the cheapest and often highly effective, commercially-made harvesters designed specifically for aquatic weed management are available. The harvesters vary in size from simple hydraulic sickle-bar cutters powered by a 5 hp engine and mounted on the front of a pontoon boat to 10,000-capacity harvesters which convey cut vegetation on board for transport to shoreline dumping sites.

Biological control

Ideally, the best weed control agent is

Troubled waters?

Otterbine Aerators

The prescription for troubled breathing, poor circulation, and changing temperatures in ponds and lakes is practical engineering that is esthetically pleasing.

These aerators range in power, circulating from 600,000 to 20 million gallons of water in a

24-hour period. Each complete, turnkey system is delivered fully assembled; no special pumps or foundations are required.

Striking patterns begin with the Starburst, Rocket, Sunburst, Constellation, or Phoenix working alone or mingled together. Add the Otterbine Fountain Glo™ lighting system for spectacular evening display as well as security or the Rock Float Cover for the illusion of natural spray.

Otterbine Aerators meet the water management needs of golf courses, parks, recreational lakes, office developments, and residential condominiums. Call or write for more information:

AQUATIC WEED

CONTROL

FLOATING PLANTS

Common duckweed (*Lemna minor*)

Biological; grass carp. Chemical: diquat, simazine, 2,4-D LV ester, fluridone.

Common salvinia (*Salvinia rotundifolia*)

Biological: partial control with grass carp. Chemical: diquat.

Waterhyacinth (*Eichhornia crassipes*)

Biological: partial control with hyacinth weevil and fungus. Chemical: 2,4-D, 2,4-D + dicamba, diquat, glyphosate.

Waterlettuce (*Pistia stratiotes*)

Chemical: diquat, endothall liquid.

EMERSED PLANTS

Pickeralweed (*Pontederia lanceolata*)

Biological: partial control with grass carp. Chemical: 2,4-D, 2,4-D + dicamba.

Alligatorweed (*Alternanthera philoxeroides*)

Biological: alligatorweed flea beetles and thrips; partial control with grass carp. Chemical: partial control with 2,4-D, 2,4-D + dicamba, glyphosate.

Cattail (*Typha species*)

Chemical: 2,4-D + dicamba, diquat, glyphosate, fluridone, dalapon.

Pennywort (*Hydrocotyle unbellata*)

Chemical: 2,4-D + dicamba, diquat, 2,4-D.

Smartweed (*Polygonium hydropiperoides*)

Chemical: 2,4-D + dicamba, glyphosate, 2,4-D.

White water lily (*Nymphaea odorata*)

Chemical: fluridone, 2,4-D liquid and granular, glyphosate.

Spatterdock (*Nuphar luteum*)

Chemical: glyphosate, fluridone, 2,4-D liquid and granular.

SUBMERSED PLANTS

Coontail (*Ceratophyllum demersum*)

Biological: grass carp. Chemical: dichlobenil, diquat, endothall liquid and granular, fenac, simazine, fluridone, 2,4-D granular.

Hydrilla (*Hydrilla verticillata*)

Biological: grass carp. Chemical: copper, diquat, endothall liquid and granular, fluridone.

Bladderwort (*Utricularia species*)

Biological: grass carp. Chemical: diquat, 2,4-D granular, fluridone.

Southern naiad (*Najas guadalupensis*)

Biological: grass carp. Chemical: dichlobenil, diquat, endothall liquid and granular, fenac, simazine, fluridone, 2,4-D granular.

Fanwort (*Cabomba caroliniana*)

Biological: grass carp. Chemical: simazine, fluridone, 2,4-D granular.

Pondweed (*Patamegeton species*)

Biological: grass carp. Chemical: copper sulfate, dichlobenil, diquat, endothall liquid and granular, fenac, simazine, fluridone, 2,4-D granular.

GRASSES AND SEDGES

Torpedograss (*Panicum repens*)

Biological: partial control with grass carp. Chemical: glyphosate, fluridone.

Maidencane (*Panicum hemitomon*)

Biological: partial control with grass carp. Chemical: glyphosate.

Paragrass (*Branchiaria purpurascens*)

Biological: partial control with grass carp. Chemical: glyphosate, fluridone, hexazinone.

Sedge (*Cyperus species*)

Chemical: partial control with glyphosate.

DITCHBANK BRUSH

Wax myrtle (*Myrica cerifera*)

Chemical: partial control with glyphosate, 2,4-D + dicamba, hexazinone, tebuthiuron, imazapyr.

Willow (*Salix species*)

Chemical: 2,4-D glyphosate, 2,4-D + dicamba, hexazinone, tebuthiuron, imazapyr.

Brazilian pepper (*Schinus terebinthifolius*)

Chemical: glyphosate, 2,4-D 2,4-D + dicamba, tebuthiuron, imazapyr.

Water primrose (*Ludwigia species*)

Chemical: glyphosate, fluridone, 2,4-D granular, imazapyr.

ALGAE

Macrophytic algae

Biological: grass carp. Chemical: copper, dichlobenil, endothall liquid and granular, simazine.

Filamentous algae

Biological; grass carp. Chemical: copper, diquat, endothall liquid, simazine.

Planktonic algae

Chemical: copper, simazine.

When you need parts, golf's top pro puts you back on course in a hurry.

With Jacobsen support behind you, you can spend more time on the course and less time waiting for parts.

As part of the strongest support network in the industry, your Jacobsen distributor stocks most commonly requested genuine Jacobsen parts. So you can pick up your top-quality, high-performance replacement parts, immediately. And have your equipment up and running at peak efficiency in almost no time.

If by some chance your distribu-

tor doesn't have the part you need in stock, or, for those emergency orders that absolutely can't wait, he can order same-day, air-freight drop-shipment from the factory. This *TimeSaver* program of ours provides you with a parts fill rate that's second to none.

Plus, ongoing training programs and field service clinics arm your Jacobsen distributor with the latest technical information, assuring you of the highest quality after-market service in the industry.

After all, there's more to being

golf's top pro than building the industry's finest equipment. So contact your local Jacobsen distributor, today. Put the industry's strongest support network to work for you. And spend more time on course, less time waiting for parts.

Circle No. 157 on Reader Inquiry Card

Hydrilla can spread by plant fragments, underground stems, seed, leafbuds or buds on underground stems.

Cattail is an emerged plant which must be controlled by chemicals such as glyphosate.

A VIRUS TO LIVE WITH

Research using a virus to biologically control a certain type of noxious blue-green algae has shown promising results, says an aquatic microbiologist with the Institute of Food and Agricultural Sciences (IFAS), at the University of Florida in Gainesville.

E. J. Phlips, Ph.D., a researcher in the Fisheries and Aquaculture Department, has isolated a virus effective in controlling one species of microcystus blue-green algae. He hopes to isolate a number of other viruses by the end of the year.

Phlips and his staff collect water samples from sewage systems, polluted lakes and waterways throughout the state searching for viruses which kill only blue-green algae. Phlips tests these viruses with the algae in his lab, since the two rarely exist together in the water.

Herbicides have been the most popular method for controlling aquatic fo-

continued on page 40

one that keeps weed pests restrained naturally. Many native plants have biological restraints that keep them from growing prolifically.

Years of research are required to ensure that the introduced organism does not become another dangerous pest. Most biological organisms will not eradicate the host plant, but will instead reduce the plant's potential to become a serious pest.

Insects and plant pathogens — Over the years, insects have proven to be the most popular biological control agents due to their high degree of host specificity.

The alligatorweed flea beetle (*Agasicles hygrophila*), discovered in South America and introduced into the United States in 1964, is the best example of an extremely successful biocontrol program using insects.

The waterhyacinth has had several biocontrol agents to help reduce its prolific growth. However, unlike alligatorweed, these biocontrol agents don't appear capable of quickly controlling the plant. Two waterhyacinth weevils (*Neochetina eichhorniae*, *N. bruchi*), the waterhyacinth mite (*Orthagalumna terebrantis*) and fungus (*Cercospora rodmanii*) can often be found associated with the plant.

Herbivorous fish — Numerous ex-

otic fishes around the world are reported to consume aquatic vegetation.

Of the fishes examined to date, the grass carp appears to be the best candidate for aquatic plant control in a variety of situations and climates, and may provide the only practical control method for water bodies where herbicides cannot be used. This fish has provided excellent control of submersed plants, filamentous algae and small floating plants such as duckweeds.

The grass carp is used by Arkansas and other states for this purpose in natural lakes and has been researched by a number of other states. Florida has conducted research and has approved the use of the triploid grass carp, which has three sets of chromosomes as opposed to the normal two sets and is thus sterile.

The three possible management strategies using grass carp:

- 1) complete vegetation removal within one to two years with a heavy stocking rate;
- 2) winter stocking, before the spring growth of weeds begins, using fewer fish to maintain a lesser amount of vegetation in the system and increasing the grass carp population as needed; and
- 3) integrated control using chemical treatments to obtain desired levels

quickly and stock grass carp to maintain this level.

Chemical control

Controlling aquatic plants with herbicides is the most commonly used method of weed control. Chemical weed control has several advantages:

- Herbicides may be directly applied to undesirable vegetation, offering a high degree of selectivity and leaving desirable levels of vegetation.

- Pre-emergence application of appropriate herbicides can provide early weed control. This may be used to promote desirable vegetation without competition during critical early growth stages.

- Herbicides reduce the need for mechanical control which can increase turbidity and affect fish populations.

- Erosion may be reduced by promoting the lower growing grass species for cover.

- Many weeds, especially perennials, that cannot be effectively controlled by other methods are generally susceptible to herbicides.

- Routine use of herbicides under a maintenance program usually reduces the cost of weed control.

For chemical aquatic weed control agents, see the accompanying chart.

LM

“One of my employees ran the mower into the lake. My wife totalled our new Volvo. And my daughter just dyed her hair purple. But what really concerns me is Pythium.”

There's one sure way to avoid worrying about Pythium. Use Subdue® fungicide. Subdue stops Pythium on contact. And once absorbed by grass roots, Subdue protects your turf against further attack for up to three weeks. So don't let Pythium get you down. Get Subdue. Because you've got other things to worry about. **CIBA-GEIGY**

A VIRUS TO LIVE WITH

from page 38

liage, but Philips says, "Viruses are a more attractive alternative because they are specific to algae."

Philips has conducted his research for the last six months with the help of a \$20,000 grant from the U.S. Department of Agriculture, part of a larger grant for the Center for Aquatic Weed Control. Similar research has been conducted in the Great Lakes region and New England with promising results, Philips adds.

His studies have been directed in part toward *lyngbya*, one type of blue-green algae found in Florida. "It forms a very dense, thick mat on the bottom of lakes, produces a bad odor and is reputed to produce toxic substances," Philips said.

Algae breeding grounds are enhanced by sewage, runoff and industrial waste dumpage into lakes and canals. Light intensity, rainfall, temperature, carbon dioxide and oxygen levels also affect the algae. Philips hopes viruses will biologically control the algae and replace or reduce the present use of herbicides and harvesting.

"A lot of blue-green algae are tolerant of herbicides, so a high concentration is used to achieve effective control," Philips said. "Herbicides are also general in their action, so they kill off good blue-green algae with the bad," he said.

He has been examining existing viruses specific to certain harder-to-control blue-green algae. "It remains to be seen how many more we will find and how effective they will be," Philips notes.

After isolating a virus, Philips says, the next step is to determine the dose requirement and longevity of the virus.

"Our ultimate goal is to establish a collection of the major bloom-forming species of blue-green algae," Philips says, "and use this as a basis for work on the development of biocontrol technologies."

He and other Center researchers have also been experimenting with controlling algae by controlling the nutrient input in lakes and also by controlling the lake environment, done by either adjusting the pH, oxygen content or the presence of competing species, such as herbivorous fish. Further studies on Florida lakes are necessary before the effectiveness of these methods can be assessed.

Circle No. 149 on Reader Inquiry Card

A 1981 decision by George Toma set the quality standard for bowl turf in the modern era.

In 1981 turf wizard George Toma elected to try an unheralded blend of three turf-type perennial ryegrasses in Super Bowl XIV.

That blend was Ph.D.[®] and Toma's decision has made a big difference in the world of sports turf ever since.

In the 1986-87 year-end classics, Ph.D.[®] was found in the Super Bowl, Rose, Fiesta and Orange Bowls.

Obviously, there's a reason for this. Sports turf managers who absolutely must have a premium quality playing field know that Ph.D.[®] will get the job done and earn them plaudits in the doing.

As Toma puts it: "I recommend Ph.D.[®] to any turf manager who must have durable, show quality turf. It germinates rapidly, develops a deep, strong root system very quickly, has excellent dark green color and can take a lot of punishment."

That's good advice from an acknowledged master of turf preparation.

JUNE 1987/LANDSCAPE MANAGEMENT 43

AN OLD MASTER

Harry Wilcox uses the knowledge of more than half-a-century in the turf business to help save teenaged knees and ankles in Pennsylvania. He works his magic like the old master he is.

by Jerry Roche, editor

Turf consultant Harry O. Wilcox has celebrated the ninetieth anniversary of his birth. He is hard of hearing and slow of foot. But a soil probe in his hands is like a sip from the Fountain of Youth.

One day not long ago, Wilcox spryly raised the trusty custom-made probe over his head and thrust it into a small bare spot on the varsity football practice field at Warren (Pa.) High School.

"Look at that," he told a handful of observers. "That's good, loose topsoil. I've been on fields where my probe bounces right off the ground."

Wilcox takes particular interest in Warren's practice field. The cultural

practices used on the field are the same ones he suggested for Upper Merion (Pa.) High School more than 20 years ago.

John "Toby" Shea, then varsity football coach at Warren, read a June, 1965 article in *Athletic Journal*, entitled "Safer Athletic Fields." Its author was Harry O. Wilcox.

Wilcox moved to Warren in 1979 and met Shea one day in 1980, a copy of "Safer Athletic Fields" in his hand.

"I'm familiar with that article," noted Shea. "I'm glad to meet the author. We've been trying to follow the practices the article describes since I first read it."

When Wilcox and county extension agent Bernie Wingert first inspected Warren's practice field (at Shea's request), they had few suggestions.

"Harry and Bernie recommended we put tile down because we had a bad drainage problem," remembers Shea. "So we tiled along a bank next to the field and along the outside of the track's straightaway on the other side. We now also have six-inch tiles along the inside of the entire track."

In 1980, Warren varsity football players suffered exactly two injuries during practices: both sprained ankles, both occurring on the cinder track during calisthenics.

Two years later, Wilcox again visited Shea (who is a practicing athletic trainer), and again asked him about injuries. The reply: "We had to tape a few ankles due to hardness of the field during dry weather when we couldn't water the field. But we had no injuries serious enough to cause any players to miss either practice or play."

The program

Warren is a small school district, and thus must manage fields using limited financial resources. Though varsity games are at the local municipal field which is mowed by city crews, Warren High employees must aerate, seed and fertilize that field. What money is saved goes toward improving three practice fields, especially the varsity field behind the high school.

Annual cost for materials used on the practice fields is \$440. Here is what the cultural program looks like:

Early spring: Aerate fields to break up compaction. After the field

continued on page 49

Circle No. 158 on Reader Inquiry Card

Harry O. Wilcox (left), probe in hand, believes that soil compaction is the athletic field manager's biggest problem. He shares that observation with Arden Walter (center) and Toby Shea of Warren (Pa.) High School.

When you can't see your water for the weeds.

New Sonar.[®] Weeds out your water, without the worry.

Maybe you never thought you had a season-long solution to your aquatic weed problems. But now, new Sonar can keep swimmers from getting tangled, fishermen from losing lures, boaters from ruining motors and property values from sliding into the lake.

New Sonar handles weed-choked water.

New Sonar is an aquatic herbicide breakthrough. It controls many of your problem water weeds, without worry. And it handles them all season long. No going back for a second or third treatment. Sonar does it right the first time.

Sonar won't restrict you like other aquatic herbicides.

When used properly, the Sonar label does not restrict swimming, fishing or drinking. So there is no need to stop using your water after treating with Sonar.

Apply new Sonar whenever...

...weeds are a problem. In the spring, summer, or fall. Treat early and keep weeds away, or treat late and clear them out. Whenever they grow, just use easy-to-apply liquid or pellets.

Apply new Sonar wherever...

...water weeds grow. Golf course ponds.

Canals. Private lakes. Even large recreation lakes. Sonar is ready to go to work.

Apply new Sonar to water-spoiling weeds.

Knock them out of commission, all season long. Claim back your water rights, with the breakthrough aquatic herbicide that delivers full-season, broad-spectrum weed control.

Gently restores nature's balance.

Sonar® — (fluridone, Elanco Products Company)

What aquatics experts have to say about new Sonar.

Terry Westergard

Owner
South Shore Fish Camp,
Lake Orange, Florida

"Sonar controls weeds longer than mechanical harvesting and I've seen no adverse effects from it. And the fishermen like the fact that they are able to fish in places where they haven't been able to get into for a number of years. They enjoy it because it reminds them of what the lake was like before the hydrilla.

"Fishermen want to go out without worrying about burning up their engines, and be able to throw in a lure and catch a fish. This is what we had 10 or 15 years ago."

Mike Mahler

Operations Coordinator
Polk County Environmental Services
(Florida)

"With Sonar, we were able to put the lakes back to the condition they were in before hydrilla came in. We've had some lakes that were virtually 100% surfaced out in hydrilla before we used Sonar. Now, it's rare to see hydrilla in those places.

"Sonar can be applied in the early spring or late winter, when our crews normally are idle. It's helped us catch the problem and knock it down before it becomes a problem.

"Most of our treatments ended up with more than 12 months of control. Contact herbicides give us about three months of control.

"On a per-acre, per-year-of-control basis, Sonar is cheaper than any other material."

Will Davis

Executive Director
Lake County
Water Authority (Florida)

"If I had to say there was one big advantage to Sonar, it's very selective on the plants it controls.

"Hydrilla is our main problem, and Sonar is our primary chemical for treating it. With Sonar, we got 99% control on Lake Yale without retreating...and we're seeing a good influx of native plants to take the place of the hydrilla.

"We're getting much longer term control, which means we're putting a lot less chemical in the water. Every year that you don't get a regrowth makes a big difference in costs over the long run. There was no cost-effective method of getting a lake clean until Sonar came along. I don't know of a chemical on the market that can even come close to it."

Paul Myers

President
Applied Aquatics,
Eagle Lake, Florida

"I was one of the fortunate few who was able to work with the product during its development stages. I was extremely excited about it because new aquatic herbicides are few and far between.

"With Sonar, we've gotten annual control with a single application in lakes and ponds. With contact herbicides, you can figure you're going to have to treat two to three times a year.

"Sonar is the most recent aquatic herbicide to be registered by the EPA and is the most highly scrutinized product in terms of toxicological testing. That's extremely important to homeowners."

Get the new Sonar story.

Talk to the Elanco products distributor near you. Get all the details on how you can weed out your water, without the worry. With new Sonar.

LANDSCAPE PROFILE

MASTER from page 44

has been aerated, bare and thin areas should be overseeded with Scott's Sports Turf Seed. A seeding rate of 2 to 3 lbs. per 1,000 sq. ft. is recommended. Apply Scott's ProTurf High Density Starter Fertilizer to the entire field to stimulate early spring growth.

Spring: Apply ProTurf High Density Starter Fertilizer to improve root development and density.

Early summer: Apply Scott's Fertilizer Plus Dicot Weed Control to eliminate dandelions and 23 other broadleaf weeds while providing a full feeding of fertilizer.

Early fall: A couple of weeks prior to the opening of the season, apply Scott's ProTurf High Density Super Fairway Fertilizer, for thick dense turf with crowd-pleasing color.

Other practices

"Compaction is potentially our worst enemy," says Wilcox, a past president of the Pennsylvania Turfgrass Council. "If you're on a limited budget, the best thing to use your money for is aeration. At least two times a year—the more the better. I've never seen a field ruined by over-aerating."

Wilcox recommends using open-spoon tines because, he says, they

penetrate into the soil up to five inches. Other kinds of tines only penetrate two to three inches, he believes.

Some turf managers put too much emphasis on applying seed, according to Wilcox. "Seed is important if you have large bare

ANY BARE SPOTS IN ATHLETIC FIELDS LARGER THAN THIS (4-5 INCHES IN DIAMETER) SHOULD NOT BE SEEDED, ACCORDING TO TURF CONSULTANT HARRY O. WILCOX.

spots," he notes. "But it just doesn't pay to seed areas smaller than four or five inches across. If you aerify and fertilizer those spots, they'll heal by themselves."

Warren High School personnel applied 50 pounds of seed to the area inside the running track, which includes the practice field, this year.

Wilcox also believes that lime should be applied according to the type of grass in use. Bluegrass

definitely needs periodic liming while turf-type tall fescue may not.

According to district maintenance supervisor Arden Walter, the fields are mowed at 3 inches during the summer and 2½ inches when football practice begins. "We don't believe in mowing too low," he says. "And the way we fertilize, we find that we've got to mow at least once a week."

Keeping the three fields playable—and safe—takes two people 30 hours per week, according to Walter.

Constant cooperation

One of the most critical requirements of good field management is cooperation from the coaching staff.

Wilcox says that coaches should try and spread out practices. He says that Northampton (Pa.) High School uses the areas beyond the end zones of its practice field so three groups of players can each use a field 60 yards long.

Shea, when he was at the controls of the Dragon football team, didn't waste opportunities to cooperate with others like Arden Walter and Norge Luvison, director of buildings and grounds. "Men like Toby Shea are doing a wonderful job," says Wilcox. "I've never seen a coach who cared so much about his players." **LM**

THE ONLY GAME IN TOWN

During the fall, the townspeople of Findlay, Ohio direct most of their attention at Donnell Stadium. So when the field tried to hide under mud, it was noticed.

By Jeff Sobul, assistant editor

The field was only two years old. But it had aged well beyond its years. Eleven Findlay High School and Findlay College football games each year, numerous soccer games and other events, coupled with wet weather and poor drainage, had taken their toll. By the end of the second football season, in November, 1985, the Donnell Stadium field was unplayable.

In fact, an NAIA Division II playoff game between Findlay

College and St. Ambrose, Iowa, had to be played at nearby Bowling Green State University.

Something obviously had to be done.

And something was done. In addition to building a separate field for soccer to distribute field use, the Donnell field was replaced again, this time with a Prescription Athletic Turf (PAT) System perfected and patented by Purdue University professor Bill Daniel, Ph.D.

Artificial turf was considered. "It was either put in a PAT system or a similar system or go to artificial turf, which I won't do," says Jack Volkmer, business manager for Findlay Schools. "It's a horrible thing to make people compete on an artificial surface."

A little help

Now, boasts Volkmer, "Donnell is probably one of the nicest high school facilities around." The installation cost slightly less than

LANDSCAPE PROFILE

\$250,000, no small change for anyone, including a small town.

All stadium maintenance is funded by the Donnell Foundation, Volkmer says. "The money doesn't come from tax money. Otherwise, we wouldn't have been able to afford to do this." The Donnell Foundation is a fund set up by the Donnell family, former owners and operators of Marathon Oil, a primary employer in the small, industrial western Ohio town.

This major undertaking began in December of 1985. Daniel, Laurel Meade and David Heiss, who are marketers of the system, all came out to survey the field after Volkmer contacted them. (They were also in attendance for the first game on the new field.)

Excavation began in December and continued through the winter, with problems other than some occasional bad weather hampering construction. "We had some real terrain problems," Volkmer notes.

"That's built on solid rock. That's a
continued on page 54

At the end of the season, after 11 games, two played in downpours, there were no visible signs of heavy wear down the middle of the field.

In one off-season, the Donnell Stadium field went from a mud hole to a near perfect playing surface when the season opened in September, 1986, after the PAT System was installed.

When it's a dirty job, but someone's got to do it...

Rain Bird PES Scrubber Valves

Sand. Silt. Algae. Dirt. Debris that would clog most valves poses no problem for Rain Bird's PES Series. These valves are designed to operate with superior precision—under even the most troublesome conditions.

A self-cleaning, flow-activated scrubber prevents valve-control water ports from clogging. PES valves incorporate many of the quality features found in Rain Bird's proven PE valve line:

- Industrial-grade plastic construction
- Reinforced nitrile rubber diaphragm
- Slow-closing capability to reduce water hammer
- Industry-high operating pressure rating of 200 psi
- 5-Year trade warranty

Maximum reliability—minimum maintenance. The PES Scrubber Valve from Rain Bird.

GAME from page 50

quarry out there," he says of the ground the field is built on.

The headaches didn't stop there. "The field when it was originally built in 1927 had an 18 inch drop-off, which nobody really knew," he explains. "When you look at the track you can see we had to move the field because it needed to be perfectly flat. One end is down and the other end is up."

Laying it down

The PAT system is constructed with a flat subgrade and plastic barrier under a system of perforated pipes. The pipes set below a special mixture of sand, peat and nutrients. Pumps connected to the pipe system can

draw off excess surface water in minutes.

When weather cleared in the spring of 1986, the PAT people began installing the system. "We have our graduation out there (on the field)," Volkmer recalls. "By graduation, they had just put in all the sand.

"If you can imagine everybody sitting in the stadium; I mean everybody looked at me like 'what did they do to the football field?' If they could have had my ass, they would have had it. Everybody goes to the games. We've got 5,000 to 8,000 for every football game. It's like the only game in town."

Volkmer adds the pumps are only used in heavy downpours on

or near game days. This occurred twice during the 1986 season. "The first game we had just a huge rainstorm. Huge. We had to hold up the game until 8:30."

"You couldn't see from one end of the field to the other," adds field maintenance manager Chuck Andrus. His job has been relatively easy. The PAT system worked so well, the field looked as good last November, after 11 football games, as it did before the season started.

"The footing was never bad (during the first game)," Volkmer notes. "That's the key thing: the footing and the safety of the ball players."

And that's no small change either. **LM**

RESOURCEFUL RENOVATION

Even when budgets are low, school systems can renovate athletic fields. Here's how a Philadelphia area school system tackled the job.

by Heide Aungst, managing editor

Bare spots speckle the field. Stressed turf clumps fight to hang onto life. Twelve gym classes, a soccer league and a junior high football team trample and tear up what's left. A kid cries after a fall on the rock-hard surface. The field cries for renovation. The field manager cries for more money. The school board cries for the lack of money.

Everybody loses.

Money may be hard to come by for some school systems, but excuses are abundant. Field managers jump at the "we-can'ts" before fully exploring the "how-tos."

Every industry has tricks of the trade and corners to cut. It's possible in athletic field management, too. Just ask the Springfield, Pa. County School District. They've used almost every trick in the book, and some they dreamed up themselves, to renovate dwindling fields on a dwindling budget.

"About 35 percent of the ground on one field was bare," says Bruce Thomas, maintenance supervisor for the Philadelphia area school district. "The school was complaining about the bare ground

Bruce Thomas, Andy McNitt and Bob Scanzaroli look at the deep root system of the turf on the newly renovated E.T. Richardson field.

and the field was lower."

Personnel

Thomas took the first step by hiring Bob Scanzaroli as grounds manager in mid-August. The school system couldn't afford to create such a position, but when the grounds

manager left for another job, Thomas made sure the replacement had the necessary turf knowledge. Scanzaroli is an '84 graduate of Penn State University.

Together Thomas and Scanzaroli consulted with the Philadelphia County extension agent, Andy

LANDSCAPE PROFILE

McNitt. States differ on their approach to extension agents. In western Pennsylvania, McNitt explains, agents sometimes cross county lines depending on their specialty.

Besides seeking McNitt's advice, Thomas looked at other fields in the area that had been renovated. He consulted with managers at local Swarthmore College, where he could see results.

Equipment

The next step was to take an inventory of the equipment the school system already had, and that which would be needed. The pair resurrected a more than 20-year-old reel mower from the grave. They got the cooperation of the local parks and golf course in sharpening the reels for free.

They did decide to replace a 30-year-old tractor with a new 40 hp version. "It was a \$25,000 expenditure from the replacement equipment budget," says Thomas. "Some school districts choose to lease them. We feel it's worth our while to purchase it. In the winter we use it to push snow."

They bought a new rotovator. The two new purchases have since been lent free of charge to other "poor" school districts which can't afford to purchase their own equipment.

Materials

The third step was to decide which fields should be renovated and what seed and other materials would be used to do it. Thomas chose two fields to start with. A third, the varsity football field, is currently undergoing similar renovation.

The first field they chose to renovate was at E.T. Richardson Junior High School. The field is used by soccer teams, lacross, softball and gym classes. The field isn't irrigated.

"We chose rye because it enabled us to put the field in use by spring," Thomas says.

The key to the field renovations is an organic material called Earthlife. The material is made from the city of Philadelphia's sewage sludge, similar to Milorganite. The difference is that Earthlife is mixed with wood chips.

Scanzaroli renovated the field—practically by himself in five days. "That was as early as we could get the field," Thomas says. "We also got

When goal areas wear away, field renovation is necessary.

a lot of support from the school district and community.

"The first day and a half, I aerated the field more than 20 times," Scanzaroli explains. He aerated with a Westpoint aerater then dragged the field to break up the cores.

By the third day, he dumped five trailers (250 yards) of Earthlife on the field and dragged it. The next day Scanzaroli aerated and fertilized. "That allows the material to drop into the holes," he explains.

The final step was to fill in the holes with Champion perennial ryegrass mix of 49 percent SR4100, 24 $\frac{1}{2}$ percent SR 4000 and 24 $\frac{1}{2}$ percent Tara. They did this using a Jacobsen verticut seeder.

The entire project cost only \$4,300: \$2,900 for Earthlife; \$450 for seed; \$300 for fertilizer; and \$650 for labor.

Multipurpose field

The next field, Halderman, is a multipurpose field used for varsity soccer, varsity lacross and community softball.

Because of the intense use, the school district decided to spend more money on the renovation to provide a good sand base. "But it

won't need to be renovated again for 10 or 12 years," says Thomas.

"Sand cuts down on compaction, but the particles have to be uniform or it will compact more," McNitt says. "You have to use more than 50 percent sand or it will turn into cement.

"Because it's an all-weather playing field the sand aids in drainage," adds Thomas.

During the renovation of this field, Scanzaroli rotovated the field three times. Then brought in the Earthlife and sand and rotovated again another three times. Then Scanzaroli graded the field and seeded with a special Springfield mix. The mix included Adelphi, Merit, Eclipse and Glade Kentucky bluegrass and Premier, Jazz and Fiesta perennial rye.

The field used 500 cubic yards of one millimeter sand at \$13,000; 300 lbs. of Earthlife at \$2,300 and \$690 of Springfield seed mix.

Scanzaroli and two other workers maintain a total of 83 acres of athletic fields on an annual budget of \$22,000. They plan more low budget renovations in the future.

After all, they'll admit, where there's a will, there's a way. **LM**

THIS TEST WON'T HOLD WATER —OR AIR.

Water passes easily through highly permeable Duon Weed Control Mat.

Just blow through Duon to see how easily air passes through it.

The proof is stronger, longer lasting plants with **DUON**[®] Weed Control Mat.

Both water and air pass easily through Duon Weed Control Mat, made of Phillips Fibers non-woven polypropylene. As a landscaper, you know how important that is to a plant's root system and to the future well-being of your big landscape jobs—especially those you use as references.

When water and air can't get through, plants die. Black plastic won't work for the long-term. And woven polypropylenes are nowhere near as permeable as nonwovens. For example, the air permeability for nonwoven Duon is about 14 times greater than for woven polypropylenes and the water

permeability for Duon is about 10 times greater.

Put our words to the test. Hold Duon under running water, then take another piece and breathe through it. Then try the same test with a competitive weed control mat.

When covered from sunlight, Duon is virtually permanent. It allows plants to thrive and impedes about 95% of weed growth (in most areas). It also keeps mulch from going down into the soil.

For your quality landscape jobs, order Duon. For further information, call Phillips Fibers (803) 242-6600.

TRACKING TRACTORS

Selecting the appropriate tractor is an important purchasing decision for a landscape manager. Here are some things to look for before making the big purchase.

better choice. Some machines are specifically designed for heavier loading and scraping.

Tire tips

Tire selection is another key consideration. Turf tires are usually desirable for mowing grass and other landscaping. Bar or lug-type tires are also suitable for many landscaping, utility and agricultural applications. Just as tires should match the application, the three-point hitch and PTO should correspond to the job and the attachments being used.

Front, rear and mid-mounted mowers, blades, loaders, snow throwers and other equipment have different requirements that should be considered during the buying process. Maintenance and safety features are also important, particularly when several employees are working with the machine.

Comfort, convenience and ease of service will increase efficiency of both the tractor and operator. Adding features that enhance performance and expand a

tractor's versatility should also be considered during the purchasing process.

"An option that's becoming more popular on smaller tractors is mechanical front wheel drive," Strome says. "This provides extra traction by supplying power to the front wheels as well as the rear, which reduces slippage in wet conditions, in loose soil and on slopes. The result is improved productivity and a unit that can easily handle a wide variety of tasks."

Weighing realistic expectations according to a tractor's capabilities will help insure that the selected unit provides optimum performance and satisfaction. **LM**

The guidelines to follow when choosing a tractor and associated attachments are as varied as the tasks for which they are used and, therefore, require careful consideration.

"It's important to determine the work that has to be done prior to purchasing a new piece of equipment," says Roger Strome, JI Case product supervisor for under-30 hp tractors. "Whether you're landscaping an office complex or mowing grass on a golf course, matching the tractor to the job will improve efficiency."

A number of criteria are involved in the buying decision, including horsepower requirements, tire selec-

tion, three-point hitch, power take-off (PTO) options and maintenance needs. All considerations should be assessed based on required performance by evaluating the type and variety of tasks and the size of machine needed to properly perform them.

Horsepower

Horsepower requirements depend upon the size and scope of the job and the amount of lifting, pushing and pulling to be performed. Tractors ranging from 15 to 30 hp will handle most mowing, scraping and loading chores.

For more rigorous work, however, a tractor from 35 to 75 hp may be a

RODEO® AQUATIC HERBICIDE

controls more than 160 types of emerged grasses, brush and broadleaf weeds

■ Rodeo can be used in and around aquatic sites, either flowing or non-flowing waters.

■ Rodeo is rapidly absorbed and translocated throughout plant tissues.

■ Rodeo is odorless, non-volatile and practically nontoxic to most animals and the environment.

■ Rodeo is biodegradable.

■ Rodeo will not leach.

■ There is no residual soil activity with Rodeo.

■ Rodeo does not bioaccumulate.

RODEO® IS NOW AVAILABLE IN CONVENIENT 1-GALLON CONTAINERS.

To place your order call us at 1-800-544-6116. You can also use this toll-free number to get more information on Rodeo. (Rodeo is also available in 2½-gallon and 30-gallon containers through our network of agents.)

No mail orders, please.

THE FIRST...4-wheel drive lightweight, 5 gang, tractor reel mower

Standard mower shown

Hydrostatic transmission, diesel, Kubota reliability

Fixed cutting unit,
with anti-scalp rollers.

Floating cutting unit
with front roller

Rear mower assembly detached

Finger-tip controls for easy fold-up
and transportation

- Low total unit weight reduces compaction
- New optional front tire track removal brushes virtually eliminate tracks, ideal for fairways
- Finger-tip hydraulic controls, for 3, 4, or 5 gang operation
- Offers the traction needed to mow slopes and in difficult conditions

- Quick detach rear mower assembly
- Small tractor maneuverability and economy
- All new cutting units with single bedknife adjustment
- Fixed or floating cutting units with quick height adjusters

Available as a standard or golf course model

On Design

MAKING A SPLASH

by Heide Aungst, managing editor

The Hyatt Regency-Scottsdale doesn't have a swimming pool. A 1/2-acre "water extravaganza" is more like it. Landscape architects SWA Group of Sausalito, Calif. worked closely with hotel architects Howard Fields and Associates of Sausalito and Hornberger, Worstell and Associates of San Francisco in designing the \$3.8 million water playground in the middle of Arizona's desert. Date palms averaging 30 feet in height surround the pool area, adding a touch of green to the blue oasis. More than 300 date palms can be found on the hotel's eight landscaped acres. Turf under the palms is a combination of bluegrass, fescue and rye. The boxes next to the pool hold California pepper trees. While guests take a dip, they can watch others playing golf at the 27-hole Gainey Ranch Golf Club. Bill Callaway, principal of SWA Group, says drainage is the biggest consideration in planting around pool areas. "Chlorine kills the plants if it gets on them," Callaway says. "You have to put drains in the deck area to take the water away." The hotel was completed in December 1986.

The Peridian Group landscape architects took two different approaches to the pools at the Ritz Carlton, Laguna Niguel, Calif. Towering Mexican fan and queen palms highlight the South pool area. Various annuals, such as blue salvia or snapdragons, are rotated to provide accents of color under the palms. Pool paving includes scored, colored concrete in a large pattern to complement the size of the pool area. The architects also installed Grasscrete paving to provide fire access around the pool.

Peridian designed the North pool area (inset) as a tree canopied garden using rusty leaf figs (*ficus rubiginosa*), California sycamores, podocarpus gracillior and tabebuia. Turf is a Marathon sod of various fescues. Flowers include impatiens and bedding begonias. The unique irregular shaped pool paving was quarried in Mexico. Peridian Group completed the project in summer 1984.

Preserving the wooded atmosphere of this home in Oyster Bay, N.Y. was the goal of designer/installer Alley Pond Nurseries Huntington, Inc. of Dix Hills, N.Y. The firm built the pool deck around existing trees, including redbuds, weeping hemlock and birch. They accomplished this by changing the grade at one end of the pool to accommodate a low retaining wall of ties supporting the deck. The design won a 1986 National Landscape Association's "Superior Award." Judges cited the different levels created by the steps as an important design element adding interest to the deck. The waterfall in the pool allows homeowners to hear water at all times.

The owners of this Fort Lauderdale, Fla. residence and pool removed all plant materials during extensive home renovations. Landscape architect J. Roland Lieber of Naples, Fla. and installers Friends Landscape Inc. of Fort Lauderdale created an illusion of privacy with plant materials. They did this by designing planter areas and raised planter boxes around and in the pool. In the boxes they planted Alexander palms, bougainvillea, self-heading philodendron, liriopse, asparagus fern and carissa. Lieber won a 1986 National Landscape Association "Superior Award" for successfully restoring the property's lush vegetation.

BOOKSTORE

345 - COST DATA FOR LANDSCAPE CONSTRUCTION 1987
Kathleen W. Kerr, Editor
 An updated unit cost data reference for designers and cost estimators. Developed to fill the tremendous need for detailed landscape construction cost data. Laid out in easy-to-use CSI format. Annual **\$32.00**

350 - HANDBOOK OF LANDSCAPE ARCHITECTURAL CONSTRUCTION
edited by Jot Carpenter
 A practical how-to reference on landscape construction. Published by the Landscape Architecture Foundation, the book carries the expertise of more than 25 landscape professionals. **\$45.00**

300 - LANDSCAPE DESIGN: A PRACTICAL APPROACH
by Leroy Hannebaum
 Geared for the commercial designer/salesperson, this is a one-stop guide to the landscape design process. Covers the entire highly competitive field including design analysis techniques, pointers on land forms, specialized business landscaping methods, environmental design guidelines, specifications, estimations, bids. **\$33.95**

370 - LANDSCAPE OPERATIONS: MANAGEMENT, METHODS & MATERIALS
by Leroy Hannebaum
 An in-depth examination that combines technical training in landscape science with methods of accounting, business management, marketing and sales. Discusses effective methods for performing lawn installations, landscape planting and maintenance. Step-by-step accounting calculations are explained in simple terms. **\$31.95**

365 - LANDSCAPE PLANTS IN DESIGN
by Edward C. Martin
 An annotated photographic guide to the design qualities of ornamental plants and their aesthetic and functional use in landscape designing. Over 600 trees, shrubs, vines, ground covers and turfgrasses are described in nontechnical language. Over 1900 photographs. Provides a basis for selecting the best plant materials for any particular use in landscape design. Contains detailed indexes that provide quick reference to particular design qualities and growing conditions. **\$55.00**

375 - RESIDENTIAL LANDSCAPES
by Gregory M. Pierceall
 An excellent reference for individuals involved in the design and development of plantings and constructed features for residential sites. Illustrations and actual residential case study examples are used to communicate graphic, planning and design concepts which are the focus of this text. **\$36.95**

665 - ARBORICULTURE: THE CARE OF TREES, SHRUBS AND VINES IN THE LANDSCAPE
by Richard W. Harris
 Provides comprehensive coverage of complete planting, site analysis, preparation and special planting methods, fully detailed coverage of fertilization, irrigation and pruning guidelines on preventative maintenance, repair and chemical control, how-tos of diagnosing plant problems, practical data on non-infectious disorders, diseases, insects and related pests and pest management. **\$47.95**

720 - SHRUB IDENTIFICATION
by George Symonds
 Pictorial key to identify shrubs. Contains more than 3,500 illustrations to check specimens. Popular and botanical names are given for each shrub and handy index tabs for quick reference. **\$12.95 paperback**

750 - TREE IDENTIFICATION
by George Symonds
 Pictorial reference to identifying trees by checking leaves, buds, branches, fruit and bark. Like its sister publication, SHRUB IDENTIFICATION, popular and botanical names are listed with index tabs for easy reference. **\$14.95 paperback**

760 - TREE MAINTENANCE
by Pascal Pirone
 The fourth edition of this guide for anyone involved in the care and treatment of trees. Special sections on tree abnormalities, diagnosing tree troubles, non-parasitic injuries and assessing the suitability of different trees. **\$49.95**

565 - WEEDS
by Walter Muenscher
 Second edition. Premier text for identification and basic natural history for seeds found in the continental United States and Canada. Ecological data on weed biology combined with excellent keys and plant descriptions make this an essential reference book. **\$39.95**

405 - WOODY ORNAMENTALS
by Partyka, Joyner, Rimelspach, Carver
 Illustrates plant identification characteristics. Organized in two basic sections: plant identification and plant disorders, this text utilizes 430 color photos, 430 line drawings and 45 black and white photos to simplify identification. **\$32.50**

410 - DISEASES & PESTS OF ORNAMENTAL PLANTS
by Pascal Pirone
 This standard reference discusses diagnosis and treatment of diseases and organisms affecting nearly 500 varieties of ornamental plants grown outdoors, under glass or in the home. Easy to understand explanations of when and how to use the most effective fungicides, insecticides and other control methods. **\$34.95**

690 - INSECTS THAT FEED ON TREES AND SHRUBS
by Johnson and Lyon
 Essential information for identifying more than 650 insect pests and the injuries they cause. More than 200 color illustrations. **\$49.50**

570 - WESTCOTT'S PLANT DISEASE HANDBOOK
by Kenneth Horst
 This fourth edition offers professionals the latest diagnostic and disease control information. Plant entries designed to simplify diagnosis, plus background on the classification of plant pathogens. This handbook gives a specific description of each disease, susceptible plants, specific symptoms of the disease, reported locations and control measures for each disease and their side effects. **\$41.95**

BOOKSTORE

010 - ADVANCES IN TURFGRASS PATHOLOGY

by Joyner and Larsen
Leading U.S. turf pathologists report on turfgrass diseases, pythium blight, snow molds, fairy rings, leaf spot, Kentucky bluegrass in Minnesota, initial and field fungicide screening, turfgrass disease resistance, etc. Contains new ideas on how to combat turfgrass problems. **\$27.95**

220 - CONTROLLING TURFGRASS PESTS

by Shurtleff, Farmanian, Randell
New comprehensive guide provides the most up-to-date information available on the identification, biology, control and management of every type of turfgrass pest. Covers weeds, insects, animal pests and diseases in detail. Also provides information on cultural management practices: the establishment, care and renovation of low-, medium-, and high-maintenance turf areas. 50 color and 400 black and white photographs. **\$27.95**

654 - MANAGEMENT OF TURFGRASS DISEASES

by J.M. Vargas
Identifies turfgrass diseases by description and illustration. Includes a holistic approach to healthy turf and lawns. Presents practical management strategies for golf courses, lawns and athletic fields. 204 pages, illustrated. **\$26.70**

615 - TURF MANAGEMENT FOR GOLF COURSES

by James Beard
Written by an eminent turfgrass researcher, this USGA sponsored text is an ideal reference and "how to" guide. Details all phases of golf course design and construction, turf management, course administration, irrigation, equipment and disease and pest control. Fully illustrated. **\$52.75**

620 - TURF MANAGEMENT HANDBOOK

by Howard Sprague
Practical guide to turf care under both healthy and poor turf conditions. Chapters cover turf in cooler and warmer regions, fertilizer use, regular turf care, weed and disease control and special turf problems. Useful seasonal schedules for management of turf areas. **\$19.00**

110 - TURF MANAGERS' HANDBOOK Second Edition

by Daniel and Freeborg
ENTIRELY UPDATED. A practical guide for the turf practitioner. Chapters on grasses, growth regulators and diseases have had extensive modification. Innovations resulting from research and practice have been added to reflect the current techniques available for turf managers. Offers recommendations for effective turf protection through integrated pest management. Included are alternate plans for providing and improving safe, uniform turfgrass for sports fields. Outline format plus newly added index make this new edition easier to use and a more comprehensive approach to turfgrass science. **\$32.95**

225 - TURFGRASS MANAGEMENT

by A.J. Turgeon
Revised edition. Covers the latest developments in turfgrass science and technology. Heavily illustrated with dozens of new drawings. Provides specific recommendations for applying the newest pesticides, fertilizers and other materials to combat turfgrass problems. A valuable reference for diagnosing problems and determining their causes. **\$32.95**

630 - TURFGRASS: SCIENCE AND CULTURE

by James Beard
Comprehensive basic text and reference source used in many leading university turf programs. Includes findings of current research compiled from more than 12,000 sources. **\$34.95**

640 - TURF IRRIGATION MANUAL

by James Watkins
A guidebook for engineers, architects, designers and contractors. Keeps pace with the latest developments in turf and landscape irrigation. Specific chapters devoted to rotary sprinkler design systems. Golf course design systems and expanded engineering and reference material. **\$23.95**

THE GOLF COURSE

800 - THE GOLF COURSE

by Cornish and Whitten
The first book ever to give the art of golf course design its due, and golf course architects the credit and recognition they deserve. 320 pages and 150 color and black and white photographs. Traces the history and evolution of the golf course, analyzes the great courses, shows how they were designed and constructed. **\$35.00**

510 - HORTUS THIRD

from Cornell University
A 1,300 page concise dictionary of plants cultivated in the United States and Canada. A reference which every horticulture professional should have. **\$125.00**

635 - IRRIGATION PRINCIPLES AND PRACTICES

by Hansen, Israelsen, Stringham
A new fourth edition of this highly successful textbook presents essential concepts pertaining to water conveyance, application, storage in the soil and use by plants. Basic underlying principles that govern irrigation practices are stressed. **\$57.00**

125 - SCIENTIFIC GUIDE TO PEST CONTROL OPERATIONS

by Truman, Bennett, Butts
Provides a sound basis for studying the technical aspects of pest control. Covers pesticides, safety, health and environmental concerns, equipment, flies and mosquitoes, rats and mice, birds and much more. **\$35.00**

PURCHASING

...for price, performance and profitability.

by Rudd McGary and Ed Wandke

Inventory control and product purchasing are not issues limited to only large companies. Today, multiple reasons exist for green industry firms to take more time making product selections.

Issues that need to be addressed are:

- legal reporting requirements for material usage,
- determination that products were applied in accordance with the label rates for the product, and
- cost impact of excessive materials usage in reducing a firm's profitability.

The process of selecting materials for the coming year should not be limited to price consideration. Today, turf professionals must make decisions about the most cost-effective products for the properties they maintain. Other considerations are the constant development of new products and the multiple formulations available.

The problems confronting a turf manager cover three basic areas. First: how to determine the true cost of products used; second: how to determine the effectiveness and selection of products to be used; and third: why

MANAGEMENT

IN BUSINESS

there is a need for variable agronomic programs for the turf being serviced.

Material costs

In analyzing the total cost of using various products to control turf problems, a system needs to provide information to the management on a daily basis. This data should be capable of fulfilling the many regulatory, accounting and operational functions needed to manage a business. A typical system should contain the following:

1. Total turf area treated by day by an employee.
2. Total product usage for the day.
3. Projection of product usage based on the agronomic program the

employees are supposed to be applying.

4. Comparative analyses of the actual product used per day vs. the agronomic program for the day vs. the area treated for the day.

5. Comparison of product usage with labels for over or under application.

6. Service calls run for the day by employee.

7. Service call product usage by area treated.

8. Reconciliation of product usage with the physical inventory.

9. Monthly summary of the daily data and its transfer into the accounting permanent records.

This system, though designed to account for product usage, also provides management with an insight into many other areas of the company's performance.

Employee performance has a definite impact on profit. Here are the areas that should be considered:

1. Total area treated for the day: was the work performed too quickly resulting in increased service calls in the future?

2. Product usage for the day: was the product applied at a rate under the

A FUNGICIDE HAS TO BE SPECIAL TO BE TREATED LIKE THIS.

There are more superintendents on more courses treating more acres with Daconil 2787® fungicide than with any other turf fungicide.

In fact, nearly two-thirds of all U.S. golf courses are now being treated with regularly scheduled applications of Daconil 2787.

Because Daconil 2787 is the only fungicide that has a proven record of delivering consistent, first-rate control of 12 major turfgrass diseases. Including such tough ones as *Helminthosporium* melting out, benomyl-resistant dollar spot and large brown patch.

What's more, there has never been a single documented case of resistance in over 15 years of continuous use. Even on courses where Daconil 2787 was applied at weekly intervals for many seasons. Convincing proof that you don't have to alternate Daconil 2787 to avoid developing resistance.

And when it comes to cost per 1000 sq. ft., a single

application of Daconil 2787 Flowable Fungicide is more economical than most other fungicides.

Plus you never have to add a costly spreader/sticker to Daconil 2787. It's already built into the formulation to assure full and even plant coverage for maximum disease prevention.

So this season, be one of the thousands of superintendents who made the right choice. Make your fungicide Daconil 2787 on tees, greens and fairways.

Fermenta Plant Protection Company, 7528 Auburn Road, P.O. Box 348, Painesville, Ohio 44077.

 **FERMENTA**
PLANT PROTECTION

Always follow label directions carefully when using turf chemicals.

Circle No. 116 on Reader Inquiry Card

label which resulted in less than desired control, or in a case of overuse, is liability a potential issue and is excessive use resulting in higher costs?

3. Product application at other than the programmed rate: does the employee need additional training to learn how to apply materials in accordance with program levels?

4. Inventory usage for the day, compare actual to physical: many issues. Are products being stolen? Are additional areas being serviced that are not going through the accounting records? Do long-term trends by all workers indicate a potential fill chart problem (if liquid) or miscalibration of spreaders (if dry)?

This calculation of material use is not the only cost needed to determine your material cost of operations. The costs of under-use and the additional resultant service calls also need to be accounted for. Since service calls require additional visits to a customer's property, the following additional costs need to be determined.

1. Direct labor to perform the service call (direct labor, fringe and supervision).

2. Vehicle costs (fuel, oil, maintenance, insurance, etc.).

3. Administrative costs to trail service call and to handle customer communications, etc.

4. Supplemental material costs not used in basic turf program (fungicides, pesticides and herbicides not applied on a broadcast basis).

To calculate non-material cost for service calls, use the following formula:

Labor	35%
Vehicle	12%
Administrative	18%
Other direct	4%
Total	69%

Most firms in the green industries can convert the above percentages into dollars by knowing the total revenue you will earn for the fiscal year. For example, if expected annual revenues are \$900,000, total cost based on the above 69 percent equals \$621,000. If 4,300 customers receive five services during a year, the employees will make 21,500 stops. Based on the services call data revealed to the PLCAA in its annual surveys in 1985 and 1986, recalls or service calls are approximately 10 percent of all calls. Total stops for service delivery would be 23,650 (21,500 plus 2,150). The total cost for each stop would be calculated by dividing \$621,000 by 23,650—\$26.25.

Thus we see that non-material costs amount to approximately \$26 per stop, whether it be to deliver the

basic program or perform a service call. Based on the results of firms in the green industries over the past three years, costs have increased to between \$30 and \$40 for all costs of a service call. Do you know what your service call costs are?

Product comparison

With the constant reformulations of turf products and the development of many new products due to environmental pressures or employee health concerns, it is important that companies keep current in technical awareness. If the time doesn't exist to stay current technically, don't rely on product sales personnel. Here are some information sources to increase your technical knowledge.

1. Turf extension agent in your market.

2. Fellow turf professionals in your area.

3. PLCAA technical director.

4. Competitive product suppliers.

5. University research on grass species you treat.

6. Publications such as *LANDSCAPE MANAGEMENT*, *Lawn Care Industry*, *Grounds Maintenance*, *Lawn Servicing* and *American Lawn Applicator*, to name but a few.

But this public body of information should be balanced with the results of the agronomic program you followed last year. Often a firm doesn't change its program enough each year even when it didn't work the year before.

The aggressive and often more profitable firms evaluate their turf results each year, conducting a survey to determine customer satisfaction with the turf density and color. Remember to take into consideration the cost of service calls. Often service calls may be the result of product ineffectiveness or non-performance even when applied to the turf at the label rates.

Wandtke and McGary are senior consultants with All-Green Management Associates in Columbus, Ohio. Dr. McGary focuses on marketing and management issues. Wandtke focuses on operations and financial questions.

Agronomic programming

Not all lawns need the same agronomic program to reach their peak condition every year. Over-selling customer expectation and then not being able to deliver the promised results is one of the principal reasons for cancellations in the lawn care industry today. Do all lawns need the same agronomic program? Shouldn't programs be changed during the year based on local conditions?

If you have answered yes to either of these questions, do you run different programs in your market for customers who have different turf problems?

Most aggressive lawn care firms—whether liquid or dry—deliver different agronomic programs to their customers in a round depending on the turf requirements. The benefit of this is often either reduced product costs or increased customer satisfaction due to the custom applications. Problems include more complicated routing if you are a liquid firm or potential employee mistakes in product application if your services use dry products.

Based on more than 15 years of experience in developing agronomic programs for the turf industry, Bob Robinson, an All-Green senior consultant, recommends the development of various cost-level programs to be used depending on the years of professional turf service a property has been served. Experience has shown that the additional time to vary the program for older customers often results in more turf density, less weed pressure and increased customer satisfaction because of the turf's durability. The turf professional must make a commitment to maintain an ongoing relationship with each customer, so the program must balance root growth and leaf blade color.

Summary

Selection of products should not be taken lightly. Analyze the results of your current program. Evaluate the service calls required during the past year and weigh the issue of increased product cost with a related reduction in service calls.

Finally, make sure your inventory system meets the regulatory reporting, usage documentation, and the management information data to assist in better managing a more profitable business. If, through improved product selection, a firm can cut its operating costs only two percent, often this amounts to a before-tax profit increase of 15 to 20 percent.

Introducing Warren's® WEED ARREST™

MULCH UNDERLINER

There are 5 important reasons new Warren's WEED ARREST mulch underliner is the best premium weed control fabric you can use:

WEED ARREST does a better job and lasts longer . . . because it's 100% premium *polyester* (not polypropylene), it resists the sun and the soil environment and harsh chemicals far better. The mulch areas on your jobs will stay cleaner years longer than your competitors' who make do with polypropylene fabrics or inferior plastic products.

WEED ARREST is easier to handle and install . . . because of its 100% needlepunch bonding, it's extra strong yet soft and flexible so you can install it faster. It also conforms and sticks to landscaped contours better than old-fashioned heat-bonded fabrics that are stiff and hard-to-handle.

WEED ARREST helps keep mulch in place . . . because of its high coefficient of friction, bark, wood chips and other mulches stick to it better. So it does a lot better job combating mulch erosion on tough grades.

WEED ARREST lets water pass thru FAST! . . . because it's needlepunch bonded (not high-temperature bonded between high-pressure rolls), water, fertilizer and air pass through it easily so soil and plants stay healthier!

WEED ARREST saves you money on every job . . . because it's easier to install, conforms to terrain better, holds mulch better, does a far better job controlling weeds and lasts years longer, your jobs go in faster and hold their beauty . . . *plus* you'll continue to save time and money because you'll have fewer callbacks and less costly rework with Warren's new WEED ARREST mulch underliner.

University tests prove it does a better job controlling 12 of the toughest weeds in the business.

It's also the only 100% *polyester** weed control fabric that meets the tough standards of today's turf professionals.

Test conducted by Clemson University.

The Professional Lawn Care Association...

WE'RE KNOWN BY THE COMPANIES WE KEEP.

Quick – who's the fastest growing lawn care company in your area? The biggest? The most profitable? It's easy to remember the top performers, isn't it? The ones who set the standards for excellence that others aim for. What's hard to understand is how they do it.

We can tell you one of their secrets, and it's a valuable business resource that all the top lawn care companies share – membership in the Professional Lawn Care Association of America.

Virtually every one of America's top 100 lawn care service companies are PLCAA members. But you don't have to be big to know a good thing when you see it. Altogether, over 1000 companies are PLCAA members, and they vary in size from giant corporations to small, growing businesses.

PLCAA is their professional edge. PLCAA offers resources unavailable anywhere else. Seminars, publications,

and training programs. Business and legal newsletters targeted to their interests, their profession. Cost-saving group health insurance. Environmental and governmental updates and action reports. And a powerful, single voice to defend them in an increasingly hostile political arena. PLCAA is all of this, and much more.

To find out more about what PLCAA can do for you, fill out and mail the coupon below or call us at 1-404-977-5222. Discover for yourself what successful companies already know – that membership in the Professional Lawn Care Association of America doesn't really cost – it pays.

FREE!

New PLCAA members receive FREE the 1986 Operating Performance Ratios for the Lawn Care Industry, a \$150 value!

RESEARCH UPDATE

More research on athletic fields

John R. Hall III, Ph.D., Virginia Tech

Many excellent research papers on turfgrass management were presented at the meetings of the American Society of Agronomy held in New Orleans in December, 1986. Some of these research papers have particular relevance to athletic field management and may assist professionals in making decisions.

A.D. Brede, formerly of Oklahoma State University, discussed his work evaluating cultural methods of reducing Bermudagrass encroachment into tall fescue turf. Surprisingly, there was no difference in encroachment of the Bermudagrass into K-31 and Mustang tall fescue. One would have thought that the more dense Mustang would have slowed Bermuda advancement. In general the Bermudagrass was most invasive under lower mowing heights, higher nitrogen levels, lower tall fescue seeding rates and in spring seeding situations.

PRACTICUM: Maintain tall fescue athletic fields with moderate levels of nitrogen (3 to 4 lbs. N/1000 sq. ft./year), reasonable mowing heights (1.5 to 2.5 inches), fall fertilization, which does not favor the Bermudagrass, and when repairing areas utilize adequate seeding rates (4 to 6 lbs./1000 sq. ft.).

P.H. Dernoeden of the University of Maryland presented a literature review on the effect of herbicides on turfgrass rooting. In Kentucky bluegrass the severity of root inhibition among the most commonly used pre-emergence herbicides at normal use was generally: bensulide > benefin > oxadiazon > DCPA > siduron.

He noted that on Bermudagrass, siduron, napropamide, prosulfalin,

metribuzin and bensulide have been reported to inhibit rooting. Root inhibition on both Kentucky bluegrass and Bermudagrass has been reported within four weeks of 2,4-D or dicamba use.

Z.J. Reicher and N.E. Christians of Iowa State University looked at pre-emergence herbicide-induced rooting inhibition as it was affected by maintenance level and noted that pendimethalin produced root inhibition on Kentucky bluegrass at normal use rates under low maintenance, but did not produce a significant negative effect under high maintenance.

PRACTICUM: When using herbicides be aware of the possible negative effects associated with their use and if possible alter management to minimize the stress. Irrigation, higher mowing heights, proper mowing frequencies, adequate aeration and proper nitrogen timing and amounts to enhance root growth can all minimize the negative effect of any herbicide-induced root inhibition.

R.S. Sowers and M.S. Welterlen of the University of Maryland reported on the use of clear polyethylene covers to enhance the sprig establishment of Midiron and Tufcote Bermudagrass. Early summer sprig establishment success was reduced with the use of tarps because of excessive heat buildup. Late season spriggings made in August, September and October with clear plastic tarp cover, established quicker, went into dormancy later and showed increased winter survival.

August and September spriggings kept under the tarp for the entire

winter provided 100 percent ground cover by July 1. October spriggings tarped for winter showed poor establishment cover on the following July 1.

PRACTICUM: Use of tarps to enhance late season Bermudagrass sprig establishment can be beneficial, however there are limits to the ability of the tarp to produce 100 percent winter survival. Avoid use of tarps under mid-summer conditions unless you can monitor them closely and avoid excessive heat buildup.

Additional management factors that will enhance establishment rate and winter survival include balanced nitrogen and potassium nutrition (2.0 to 2.5 lbs. of nitrogen and potassium/1000 sq. ft. disc into the sprig bed). High mowing heights late in the season will help retain soil heat and insulate crown tissue. Adequate irrigation will promote rapid growth. Additional potassium applications late in the growing season will likely improve winter survival of the less winter hardy Bermudagrass cultivars.

R.L. Henderson and D.V. Waddington reported on their attempts to measure impact absorption on athletic field soils. Impact absorption was measured by quantitating the peak decelerations imparted to a falling object when dropped on various grassed and ungrassed surfaces.

Grassed clay soils had 21 percent higher peak decelerations ("hardness") than grassed sand soils. When these same soils were bare, the peak deceleration rates increased 21 percent on the clay soil and 100 percent on the sand soil. Core aeration of a bare surface reduced peak decelerations 33 percent.

PRACTICUM: Reduce potential athletic field-related injuries by maintaining a good dense turf cover. Utilize core aeration on athletic fields as often as growth rates, soil moisture and air temperature conditions are adequate to minimize the time the field surface is disrupted by the cultivation. **LM**

Irrigation Guide**

When you use Poast[®] herbicide, the grasses are always greener on the other side.

If you want to be the envy of the ornamental world, consider Poast herbicide.

Poast delivers consistent, gentle control of your toughest grasses. Like bermudagrass and crabgrass, quackgrass and foxtails. And in your most valuable greenery. Like flowers, shrubs, trees and ground covers.

With Poast, you don't have to bother with directed or shielded sprays. Because Poast is proven

gentle to ornamentals. You can apply Poast over-the-top at all stages of ornamental growth. So you don't have to worry about soil residue or leaching. And you

don't need soil incorporation or moisture to activate either.

Best of all, Poast saves you all the time, labor and expense of handhoeing.

So this year, let Poast take care of the grasses. So you can take care of the rest.

From BASF. Always follow label directions.

Chemicals Division

Turf disease diagnosis on the course

For fans of the old Bullwinkle cartoon shows, this is a familiar scenario:

Bullwinkle (in magician's outfit): "Hey Rocky, watch me pull a rabbit out of m'hat."

Rocky: "Again?"

Bullwinkle: "Nuthin' up my sleeve and...presto!"

And out of the hat comes an angry lion, tiger, rhinoceros, etc.

For a long time, turfgrass managers have used similar tactics trying to diagnose turf diseases, often with similar unpleasant results. And it took a lot longer. Fortunately, a solution could be at hand.

Agri-Diagnostics Associates of Cinnaminson, N.J. has introduced, via limited distribution, a disease detection kit that is both accurate and fast.

The kit, which involves a series of 12 steps (see diagram), is designed to detect turf diseases before visible symptoms appear. In doing so, it makes a preventive spraying program more effective. The kits identify pythium blight, brown patch and dollar spot.

How it works

The diagnosis process, which takes roughly 3½ hours, works by matching antibodies in an assay on the end of a dipstick with a specific plant pathogen. A positive reaction creates a de-

posit of insoluble colored product on the end of the dipstick.

By comparing the intensity of the color on the dipstick to known standards, a diagnosis of the extent of the disease can be made. The color's intensity is measured in a field-adaptable reflectometer, the disease detection meter included when kits are ordered. The higher the number displayed by the reflectometer, the more pathogen present.

Ohio State University turf pathologist Bill Shane has tested the pythium kit at four sites: three at the university's Scarlett and Gray golf courses; one at a test plot. "It seems to be accurate in that if a sample has pythium the kit will pick it up," Shane comments. "In no case did I feel pythium was in the sample at a significant level that the Agri-Diagnostics kit couldn't pick it up.

"It's good to use as an informative tool to verify what (the superintendent) believes is pythium," he says. "It does provide that extra bit of knowledge they need to feel good about their spray program."

University of Minnesota plant pathologist Philip Larsen has also been testing the pythium detection kit in his lab. He has found that perhaps the best time to use it is when the first visual symptoms of a fungus appear,

before they are distinctive enough for a specific identification. "You can't tell the difference in the early stages, but the kit can," he notes. He adds that the kit is a good monitoring tool to see if and when further applications of fungicide should be made.

"A more subtle use would be to be able to detect the presence of fungus before visual symptoms appear," Larsen says.

Shane concurs. "It will be curious to see if the kit can be used before the fungus reaches symptomatic levels."

Vonnie L. Estes, Agri-Diagnostics' product support specialist, says the kit can be used in such a capacity, adding that the company uses this ability as one of the kit's selling points.

While the kit has been marketed to golf course superintendents thus far, Estes says that kits for ornamentals and lawn care are forthcoming, probably in 1988.

Distribution of the kit has reached only Indiana, the Chicago area and northern New Jersey thus far, but distribution will be widened in 1988. LM

If you'd like more information on the disease detection kits, contact Agri-Diagnostics at (609) 829-0110 or write: 2611 Branch Pike, Cinnaminson, N.J. 08077.

This illustration shows how to use the turf disease detection kits.

FOR THIS YOU NEED A MOWER WITH MORE THAN JUST YOUR AVERAGE GARDEN VARIETY ENGINE.

For a job like this you need an engine you can depend on. You need a Kohler Magnum engine.

All Magnum engines feature electronic ignition for fast, sure starts. Twin cylinder models include full pressure oil lubrication, with automotive-type oil filters. Additional features include dual element air cleaning, PosiLock™ connecting rod cap, optional Oil Sentry™ low oil sensing and a two year warranty that covers commercial use.

Magnum engines range from 8-20 H.P. in horizontal and vertical shaft designs.

We designed Magnum engines to require fewer service parts and less routine maintenance, so your equipment will spend less time in the shop and more time on the turf.

To find out how you can benefit by having Magnum engines on your equipment contact: Kohler Engine Division, Kohler Co., Kohler, WI 53044, 414-457-4441.

DURSBAN* sends pests packing.

It's one of America's leading turf insecticides —and Lebanon has it!

Your green, green grass is prime real estate to chinch bugs, sod webworms, billbugs and other unwanted insect guests.

But their lease will be up when you use Lebanon's line of DURSBAN products. And your turf will look better too!

Keep pests on the move.

Lebanon Insect and Grub Control with DURSBAN gives efficient control of a broad range of soil and surface feeding insects on turf and ornamentals. Country Club 19-4-6 Fertilizer/Insect Control with DURSBAN gives you pest control plus the essential nutrients you need to grow thick beautiful turf.

Both of these easy-to-use granular DURSBAN formulations can be applied with any spreader. Just water-in according to directions and those troublesome pests will be sent on a permanent vacation.

Start making your turf prime real estate for you.

Call our **Greenline** today at 1-800-233-0628, in Pennsylvania call 717-273-1687, for more information on our complete line of premium quality fertilizers, combination products and straight chemical products.

PROBLEM MANAGEMENT

by Balakrishna Rao, Ph.D.

Preventing weed growth

Problem: Can you suggest any method which would control growth before germination in a large bed of wood chips (without damage to large locust trees)? (New York)

Solution: To manage weed (annual or perennial) growth before germination in wood chip beds, apply pre-emergence herbicides in the fall or early winter and again in the spring or summer as needed. For annual weeds, apply Princep in fall at 3 lbs. active ingredient (AI) per acre. This treatment will provide weed control until late spring or early summer at which time another pre-emergence herbicide application should be provided.

Other pre-emergence herbicides, such as Ronstar, Dacthal, Devrinol, Dual, Enid, Lasso or Surflan, can be used alone or in combination with 1 lb. of Princep in summer. These combination treatments will increase the residual activity period as well as provide control of a wider spectrum of weeds. If the Princep was used at 3 lbs. AI per acre rate in fall or winter, do not use 2-3 lbs. AI per acre of that material again in spring or summer. However, if Princep was not used in fall or winter, then it can be used at the 3 lbs. AI per acre rate in spring or summer.

Rangeland herbicides

Problem: Is there a herbicide for rangeland that would control big and little sage brush (greasewood)? (Canada)

Solution: In reviewing the literature, no specific recommendations for sage brush control were found. Sage brush along with mugwort (*chrysanthemum* weed) and wormwood belong to the same genus *Artemisia* (Compositae). Most of these are aromatic herbaceous plants growing in dry areas in the northern hemisphere. Since both mugwort and wormwood can be managed by the application of a pre-emergence herbicide like Dacthal, it is probable that sage brush also can be managed by the same chemical.

In addition, mugwort can be managed by the use of post-emergence herbicides, like Casoron or Eptam. These need to be incorporated into the soil. These post-emergents also may be active on sage brush. Since we were unable to find any recommendation for sage brush control, check with the Canada Department of Agriculture or Ministry of Agriculture to learn more about the activity and feasibility of using the above-mentioned products. Read and follow label specifications for best results. **LM**

Balakrishna Rao is Director of Lawn Care Technical Resources for The Davey Tree Co., Kent, Ohio.

Questions should be mailed to Problem Management, Landscape Management, 7500 Old Oak Boulevard, Cleveland, OH 44130. Please allow 2-3 months for an answer to appear in the magazine.

FLUF®

A Perfect Marriage

In recent years more university studies (such as Michigan State, Ohio State, Penn State, Texas A&M, VPI, University of Illinois, etc.) have shown that balanced rates of N&K are ideal for summer feeding program on all fine turf.

WHY:

- (1) - the reason is simple — N without K gives soft, lush growth — N with balanced K gives strong, hard growth.
- (2) - spoon feeding — small amounts of a balanced diet of N&K is agronomically better for the plant.
- (3) - Fluf® - being a slow release source of N has proven superior, as a non-burning source of N during the summer months.
- (4) - Fluf® 10-0-10 is easily mixed with fungicide sprays compatible with most pesticides, adjuvants and micro-nutrients.

RATES:

- (1) - Fluf® 10-0-10 - use at 8-10 fluid oz./1,000 square feet for greens, tees, aprons and 12 fluid oz./1,000 square feet for fairways.
- (2) - spoon feed the above rates on a 7-10 days basis: 8 oz., Fluf® 10-0-10 will give 1/16 #N and 1/16 #K per treatment.
- (3) - combine Fluf® 10-0-10 with TruGreen™ (at 2-4 oz./1,000 square feet) for minor element sources of iron, magnesium, zinc, copper, etc.
- (4) - 8 oz. of Fluf® 10-0-10 per 1,000 square feet will cost less than \$.50/1,000 square feet - or approximately \$20/acre.

Greens conditioner attaches to mowers

Jacobsen's exclusive Turf Groomer greens conditioner will be available for use on the company's line of walk-behind greens mowers. It can now be attached to the Greens King IV plus

19- and 22-inch greens mowers.

The Turf Groomer lifts up and cuts horizontally-growing grasses and surface runners, which are then clipped by the mower reel.

The strong vertical grass resulting from regular use of the groomer provides a smooth putting surface, in-

creasing green speed by as much as 25 percent without lowering cutting height or disrupting play.

Weed control fabric is made of polyester

New Weed Arrest from Warren's Turf Nursery is 100 percent polyester for resistance to sun damage and decomposition, according to Emory Hunter of Warren's.

The product is made by Hoechst Fibers to be highly water-permeable, and it has a good coefficient of friction so it will not slip as much as some other materials, Hunter notes.

Because of its composition, Weed Arrest is highly pliable and its high elongation (stretch) allows it to conform to every contour of the landscape.

In a study done at Clemson University, Weed Arrest provided excellent control of johnsongrass, yellow nut-sedge and large crabgrass.

MAVRIK[®] ALL THE AMMUNITION YOU NEED.

Insect and mite protection from tee to green.

MAVRIK AQUAFLOW[®] Insecticide is a broad spectrum insecticide and miticide—in fact, it eliminates practically every problem except divots.

MAVRIK goes after pests that live in turf, in shrubs, in trees. It kills chinch bugs, sod webworms, mites, cutworms, leaf feeding caterpillars, aphids, whiteflies, leaf beetles and others.

There has never been a single product that handles so many pests, while being so safe to plants, convenient to use and easy to apply. MAVRIK is a non-restricted material, and it has been tested on more than a hundred ornamental species without a report of any phytotoxicity.

MAVRIK is a water-based flowable, so it's easy to mix. There is little residue and no odor—you can use it Friday afternoon and the members won't get their noses out of joint over the weekend. After a spray has dried, it's easy on bees. And it won't harm bird species.

You won't find the convenience and broad spectrum coverage of MAVRIK in any other product. And since MAVRIK is available at your local distributor, all you have to do is ask for it.

We are looking for result oriented Managers who know how to manage people. If you're looking for opportunity and tired of the pace you're now at, call Gordon Crenshaw - 404-888-2770.

Landscape Architects/Supervisors (project foremen) to join a nationally acclaimed firm looking to expand into its second generation Long Island area supports a high budget landscape industry. Year round employment, company benefits and continuing education available. Experienced and aggressive people send resume to: **GOLDBERG & RODLER, INC.,** 216 East Main Street, Huntington, New York 11743. 10/87

SOD FARM MANAGER: Maryland Agricultural Product Company offers a unique opportunity for a person who seeks a management position with excellent advancement potential. We are looking for an individual knowledgeable in all areas of sod production and management. Applicant should have a B.S. Degree or the equivalent in agronomy. Good starting salary and benefit program. Send resumes in confidence to R. Friedberg, Zoysia Farm Nurseries, 3617 Old Taneytown Road, Taneytown, Maryland 21787. 6/87

THE TRUTH IS: Most management positions are never advertised outside the company. They are filled from within or by word of mouth. We have access to the inside jobs that companies do not advertise in the newspapers or trade magazines. **GREEN INDUSTRY RESOURCES CORPORATION** can locate management positions suited to your needs. Write or call Beecher Smith, 25230 Conrad Ct., Damascus, MD 20872, (301) 253-5787. All inquiries are confidential. 6/87

ARBORISTS: Fast moving and well respected arboricultural firm looking for bright, energetic, dedicated and responsible person. Self-starter to head new sales, personnel management, field operations, contract bidding and negotiations, and full supervision for all manpower and equipment. Applicants must have horticultural background, college degree, direct practical experience, and computer knowledge preferred. Salary commensurate with background. Good company benefits with strong growth potential. Send resume with salary history (mandatory) in strictest confidence to LM Box 421. 6/87

BANOL®

Positive Prevention or sure cure for Pythium disease

Preventative control of Pythium blight and damping-off can save you from major turf loss to these destructive diseases. Just apply BANOL® fungicide every 7 to 21 days when conditions are favorable for disease development.

But if Pythium is already damaging your turf, cure it fast with BANOL. Applied at the higher rates, this highly-effective fungicide soon has Pythium under control.

BANOL is systemic, so it won't wash off like contact fungicides. And unlike many fungicides, BANOL shows no indication of resistance development. Further

advantages: non-phytotoxic, non-leaching, compatibility with other fungicides and insecticides.

For complete information on nourishing and protecting your turf, join the NOR-AM Turf Management Program. Write to: Communications Department, NOR-AM Chemical Co., 3509 Silverside Road, P.O. Box 7495, Wilmington, Delaware 19803.

IMPORTANT: Please remember always to read and follow carefully all label directions when applying any chemical.

HERE'S ONE OF
THE FEW TURF
PROBLEMS WE
CAN'T PREVENT.

Look to Chipco for full-course
protection against disease,
insects and weeds.

When it comes to turf care, you look for products from companies you can count on, year in and year out. That's why more golf course superintendents look to Chipco professional turf products than any other brand.

Over the past 30 years, Chipco has developed outstanding turf products such as Chip Cal many superintendents will remember for its outstanding control of poa annua. More recently we introduced Chipco® Ronstar® preemergence herbicide, Chipco 26019 fungicide and Chipco Mocap® nematocide-insecticide.

But we're not standing still. Just last year, we ushered in a new era in pythium prevention with our new Chipco Aliette® fungicide—the first of a new generation of advanced chemistry to carry the Chipco name.

Naturally, products like these are only as good as the company that stands behind them. And nobody offers you more technical support than Chipco with our field force exclusive to turf and ornamentals.

In 1987, Chipco will introduce new formulations of three Chipco products. But we're not stopping. Exciting new products soon to earn the Chipco name are in various stages of development.

So when it's time to order your turf care products, remember Chipco, the company with the ongoing commitment to helping you care for your course.

Rhone-Poulenc Inc., CHIPCO Department,
P.O. Box 125, Monmouth Junction, NJ 08852.

CHIPCO®

Please read labels carefully and use only as directed.
Chipco Mocap 5G is not yet available for sale.

CHIPCO® RONSTAR® MOCAP® and ALIETTE® are registered trademarks of
Rhone-Poulenc Inc.

**Most companies feel that people
are their most important resource,
*but are they the best managed resource?***

From left:
James C. Cabrera,
President,
and William J. Morin,
Chairman.

Managing people in today's world has become a true challenge in these four critical areas:

- Using *Outplacement Counseling* for terminations and staff reductions.
- Offering Pre-retirement planning and actual *Retirement Counseling*.
- Increasing productivity through rejuvenation of "plateaued" employees—*Directional Counseling*.
- Training managers to improve in:
 - First-line supervising*—still a special need for most companies.
 - Employee selection*—proper recruiting minimizes problem employees later.
 - Performance appraisal*—in many cases, managers still don't know how to counsel employees properly.
 - Communication skills*—always the core challenge for most managers.

Over the last 20 years, Drake Beam Morin, Inc. has assisted over 3000 companies and organizations in managing their human resources effectively.

Call or write: William J. Morin, Chairman and James C. Cabrera, President,

You make it a work of art. Surflan® keeps it a picture suitable for framing.

Surflan stops more than 50 different weeds and grasses before they emerge. Yet it's labeled for use on more than 175 different ornamentals. No other ornamental herbicide can top these numbers.

Surflan preemergence herbicide is so gentle on your established shrubs and ornamentals you can spray it directly over the top, even over sensitive ornamentals like petunias.

At recommended rates of 3 oz. per 1,000 square feet, Surflan keeps tough weeds out all season long. That makes your work a real work of art.

Choose from quarts or gallons. Call your Elanco distributor or write:

Elanco Products Company
A Division of Eli Lilly and Company

weed control.**

Athletic fields: Art or science?

Art: Human effort to imitate, supplement, alter or counteract the work of nature.

Science: The observation, identification, description, experimental investigation and theoretical explanation of natural phenomena.

Which definition best fits athletic field management? "Right now, it's an art," says Steve Wightman, field manager of Denver's Mile High Stadium. "But it's time to start applying scientific knowledge to it."

Wightman is right. Mowing, aerating, and watering are like carefully implemented brush strokes bringing texture and character to the overall picture. Good field management supplements the work of nature. It is an art.

But in this month's issue we examine the scientific aspect of field management. Many of you have never heard of an oscilloscope or a G-max before. But by the turn of the century, they will be words as common as mowing heights when discussing good field management.

Some field managers already are applying the concepts. I recently met with Lakewood, Ohio school officials who are installing a synthetic Balsam surface on two fields at the high school. They had done the research and assured me that artificial was the only way to go. I wasn't convinced. "I plan to have an independent lab test the field annually," explained Jim Stanton, director of operations. "It's written into the contract that the G-max can't exceed 95 or they'll replace the field."

That was the first time I heard a field manager refer to a G-max value. I'm still not convinced. But if Stanton follows through with that plan, I am somewhat relieved.

The Lakewood fields are synthetic, but the same technology can be applied to natural fields. "Every field manager needs to know about G levels," says Jim Watson, Ph.D., vice president of the Toro Co. Watson says that "shear strength" of the turf is an equally important issue in need of an accurate and available measuring system.

Eliot Roberts, Ph.D., of the Lawn Institute points out that the Stimpmeter is used to measure the speed of golf greens, so an instrument to measure playability of an athletic field is not far-fetched.

The argument against such measurements is the weather which changes field conditions. But if a manager knows what the optimal G-max level and shear strength of the field is, then weather can be a tool, not a hindrance, in keeping the field in good condition. Managers need to look at both perspectives in caring for a field. By creatively nurturing a field, it is an art. By technically measuring playability, it's a science.

By doing both, it's safer for young athletes.

Announcing
the dawn of
a new era
in pythium
prevention.
Chipco[®] Aliette[®]
FUNGICIDE

The first fungicide that helps
your turf defend itself.

You've heard about it. You've read about it. And now it's here. New CHIPCO ALIETTE[®] fungicide for turf. And with it comes a revolutionary new way to stop the spread of pythium blight. Unlike conventional fungicides, CHIPCO ALIETTE stimulates a natural defense mechanism within each blade of grass. In doing so, it actually helps your turf defend itself against pythium blight.

CHIPCO ALIETTE also eliminates the need for costly, time-consuming watering in of fungicides. And that's important for two reasons.

First, watering in adds to the high humidity that favors pythium development. Plus, soggy turf can interrupt play. But CHIPCO ALIETTE goes on quickly and easily to keep your course in play.

Best of all, CHIPCO ALIETTE gives you long-lasting pythium protection at a down-to-earth price. Based on cost per day of control, CHIPCO ALIETTE is one of your best fungicide values.

This year, don't let pythium ruin your turf *or* your reputation. Call your turf products dealer today and ask for new CHIPCO ALIETTE.

Turf-Type
Perennial Ryegrass

Still the Best

That's right. For the second year in a row Palmer turf-type perennial ryegrass scored number one in the National Ryegrass tests conducted by the U.S.D.A. coast to coast:

U.S.D.A. National Perennial Ryegrass Test* Turf Quality 1-9 (9 = Best)

Variety	2-Yr. Avg.	Variety	2-Yr. Avg.
Palmer	5.9	Derby	5.5
Gator	5.9	Yorktown II	5.4
Prelude	5.8	Cowboy	5.4
Repell	5.8	Pennfine	5.3
Tara	5.8	Diplomat	5.3
Premier	5.7	Regal	5.3
Citation II	5.6	Barry	5.2
Manhattan II	5.6	Delray	5.2
Blazer	5.6	Omega	5.1
All Star	5.6	Elka	5.1
Ranger	5.6	Manhattan	5.1
Birdie II	5.5	Citation	5.0
Fiesta	5.5	Linn	3.4
Pennant	5.5		

It's no wonder courses like Bay Hill in Florida, Shinnecock in New York, PGA West in California and Sahara in Nevada are only a few of those that are demanding the excellent performance of Palmer.

As a turf professional wouldn't it be nice to know you're using the best? Use Palmer.
