## **Pricing the takeoff**

Part III of III: A thorough costing and documentation system will provide a solid base for managing and controlling your business.

ing man-hours, crew requirements, mate-

rial, equipment and total costs. Using one

(or all) of the three sources mentioned

above, calculate the estimated cost of each

item, and fill in the cost in the appropriate

methodical

unusual.

Several formats of bid pric-

ing may be used or

required by clients. The

method never varies in

spite of the final form the

bid price may take. Bid

prices for work may be

presented (or required)

in certain formats. Most

common are lump-sum

bids and unit-price bids.

Also, a combination of

these two forms is not

a unit-price bid, each

item listed may be detailed in specifica-

Unit-price bids: In

takeoff

column on your estimating sheet.

## by Sylvia Hollman Fee

Pricing an estimate is the final step before placing the proposal before your client.

Takeoff lists are prepared for hard construction, site work, plantings, irrigation, and so on. Each major category is kept separate in the methodical takeoff listing.

Fig. A refers to square feet, linear feet and cubic vards because those are the reasonable dollar value units of measurement. These units of measurement will also refer to the corresponding labor required for installation.

In the hard construction takeoff (Fig. A), the estimator's common sense confirms related quantities such as the concrete slab and the surface stone paving. A variance in height of the railroad tie wall has been noted and measured.

Once all the work has been identified and listed, prices are added to the takeoff.

Your most accurate price source is your firm's historical cost data from past projects. Other sources are local suppliers and subcontractors and annual cost data publications.

Landscape and Site Work Cost Data show-

Caution is advised on pricing unit-price

bids (sometimes called line-item bids). A methodical takeoff of all items contained within a unit-price bid list is necessary.

An example of unit prices that could confound your bid for lawns could be seeding as a unit price and loam as a unit price. This calls for an estimator to break up a system often priced as one unit.

Lump sum bids: It't not unusual for the landscaper to propose all site work, construction, planting and so on for one total price.

Padding-Padding (percentage markups dependent on "uncertain events or chance") have no place in a quantity takeoff.

A solid estimate is based on a methodical takeoff list of all items that must be paid to complete the job.

## Fig. B

Irregular areas, deliveries, taxes, overhead and clean-up should be thought out in advance and figured into your prices. They should appear as contingency items. If you don't know it, you can't project it.

If there are circumstances around a bid item that are uncertain, that concern may be handled by listing the item on the estimate with a dollar value attached.

Keep in mind, your cost items form a valuable base for the job budget at the time of installation.
