

SELF-PROPELLED SOD HARVESTER

“...to make more money in the sod industry, you gotta go to **Princeton!**”

Professionals, experienced and knowledgeable in the nursery and sod industries designed and developed Princeton machinery to *save you time and money!* Custom hand-crafting insures consistent quality control and provides proven low maintenance cost!

Princeton Self-Propelled Sod Harvester

Save time, money, man-hours. Increase production! Now—one driver and two loaders do the work of a large field crew. Harvest up to 1,500 sq. yds. per hour . . . completely palletized, ready for shipping.

Efficiency and safety features far surpass industry standards. Factory warranty on all parts and labor protects you for 90 harvesting season days!

Introducing—The Princeton “Tow-Boy”

The “Tow-Boy” is the first pull-type sod harvester to incorporate the dependability, efficiency and custom-construction of a Princeton self-propelled harvester . . . at *one-third the cost!*

Developed to meet the special needs of the smaller volume sod producer, the “Tow-Boy” operates behind any adequately-sized and equipped tractor.

The E-2 Transplanter

This remarkable new addition to the Princeton line of quality equipment can greatly reduce the time and labor required to transplant trees and smaller plants. Plant 600 to 800 6' to 8' trees per hour with one driver, one planter . . . up to 1,500 2' to 3' trees or plants per hour with one driver, two planters.

The E-2 Transplanter *can pay for itself two times over* in its first season.

For demonstration, information or literature, write or call collect: Don Bowman, General Manager

Brush Control from page 42

Key factors that affect performance of this new brush control agent are the species present, coverage of foliage and stems, time of application, rate of application, and use of a surfactant. Rain immediately following an application may decrease effectiveness of control; no rain for at least six hours following treatment is necessary for best results.

extending the spray season for brush control in a number of areas, since the best time to apply it comes in late summer and early fall, according to F. E. Gonzalez, product development specialist. Last year, a number of utilities, municipalities, airports, railroads, and highway departments applied the compound on limited areas. It is expected that these areas will be checked closely this coming spring, to measure control and establish plans for broader use. □

IBDU is turned on by something you can turn off.

On a hot day, most slow release fertilizers aren't so slow. Their release rate depends on temperature and bacterial activity. As the thermometer climbs higher, they release faster and faster. Then you spend more and more time mowing to keep up with the extra growth.

IBDU is activated by water, not temperature. As long as there is moisture in the soil, it releases nice and slow. In hot weather or cold, rain or shine, IBDU gives your turf a steady supply of nitrogen.

Even when you need knee boots outside, IBDU will not overfeed your grass. IBDU's solubility is controlled so it releases nitrogen at a slow, steady rate no matter how wet the soil.

When it's hot and dry, just water turf normally. IBDU does a beautiful job of making your grass grow greener, slower, longer.

Please send me more information about IBDU

CROWN CHEMICALS Presents

Roundup[®] is New!

Starts where most programs stop. Designed especially for industrial vegetation control.

Let us show you how Roundup works:

1. Apply Roundup to plant leaves and stems above the ground.

2. Roundup moves through all parts of the plant; also, underground reproductive tissue.

3. Visible effects usually occur within two to ten days. The plant begins wilting and yellowing . . .

4. . . . advancing to browning and deterioration of all plant tissue.

5. Result: Vegetation controlled with no regrowth from the underground reproductive tissue.

"Time is money in my book, so I feed trees with Jobe's."

Jack Fannin
Superintendent
Congress Lake Club
Hartville (Cleveland),
Ohio

"Jobe's Spikes are clean and easy to use. They're a great time saver, so they're a money saver, too. Even inexperienced help can feed trees fast with Jobe's. There are no bags to lift or ingredients to mix. No drilling.

"We used them on Crimson King maples and Snow Drift crabapples. The trees had shown inconsistent growth for the past five years, so we applied 5 spikes to each tree the first week in November. By spring, we could measure the difference.

"Another advantage of Jobe's Spikes is very little loss through leaching. There's little if any run off in heavy rains. The fertilizer stays on target. Best of all, with Spikes we can keep exact records of how much fertilizer each tree receives over a given period of time, eliminating 'by gosh and by golly' methods."

Jobe's Tree and Shrub Spikes are easy, economical and effective. One spike per inch of trunk diameter feeds a tree for a full year. All you do is drive the Spikes into the ground. Tests at Purdue University have proven Jobe's as effective as drilled fertilizer. Write for the complete report.

Save time and money. Order Jobe's Spikes through your jobber or order direct. \$30 per case (105 spikes) prepaid. Minimum order, 5 cases. \$25 per case for 15 or more cases.
