DDT alternative shows promise

Ever since the publication of Rachel Carson's now famous book, "Silent Spring," and the subsequent government ban on DDT, scientists have been looking for a substitute for the insecticide which would satisfy both agriculturists and environmentalists, i.e. one which would effectively control pests but have minimal side effects on the environment.

Brigham Young University Professor Gary Booth thinks he's as close as anybody to helping find the substitute. For the past seven years, Dr. Booth has experimented with the insectidice known as Dimilin and he says it could replace significant uses of the now outlawed DDT with little environmental effect.

According to Dr. Booth, the chemical appears to give excellent control on at least 30 species of insects, including several species of mosquitoes, cotton boll weevil, cabbage butterfly, Colorado potato beetle, tussock moth, cabbage loopers, stable fly, horn fly, house fly, hemlock looper and several soybean insects.

The Environmental Protection Agency has already granted registration of Dimilin for use on the gypsy moth, one of the serious defoliators of America's northeastern forests. Petitions to use Dimilin on soybeans, cotton and mosquitoes are now pending before the EPA. Dr. Booth is hoping for approval sometime this year.

Dimilin is a relatively simple compound as far as insecticides go. It was discovered by scientists in the Phillips-Duphar labs in Holland who were trying to put two very effective herbicides together to make a topnotch weed killer. The results wouldn't kill a single weed, but proved to be very effective on insects.

Dimilin acts by interfering with the synthesis and desposition of chitin, a structural substance that is one of the main components of insect exoskeletons. As a chitin inhibitor, Dimilin interferes with the formation of the larva's cuticle. At the time of molt, the treated insect's cuticle is improperly formed, which results in death from rupture of the new malformed cuticle. The insect simply starves to death.

In the United States, Dimilin is being developed by the Thompson-Hayward Chemical Company. Dr. Booth has been responsible for about 85 percent of the environmental research on Dimilin.

He was able to speed up the research required by the EPA on new insecticides by testing Dimilin in miniature ecosystems, a revolutionary procedure he helped develop during his post-doctoral work at the University of Illinois under the direction of Dr. Robert L. Metcalf, who conceived the model ecosystem concept.

The miniature nature systems with land and water surfaces, were set up in small aquariums. Then plants and animals were treated with Dimilin and introduced to start a miniature, seven-step food chain similar to what is found in the environment. After 30 days, measurement were taken to determine how much of the insecticide was dissolved and excreted, which organisms were likely to be affected by Dimilin and how degradable the new material was.

"It takes only 30 days in the laboratory to find out what a new insecticide will do to the environment," Dr. Booth explained. In contrast, DDT was used 20 years before mankind began to realize it was doing more to the environment than killing pests.

After Dimilin passed the safety tests in the model ecosystems, Dr. Booth began field tests. During his seven years of research with Dimilin, he has conducted numerous studies on the environmental effects of the insecticide and he says it is the safest compound he has ever studied.

Many water animals were tested, including the blue claw and fiddler crab and grass shrimp, with no bad effects. Extensive tests were also *Continued on page 52*

Ford power for grounds maintenance

DDT substitute being studied

Continued from page 51

conducted on quail, frogs and snails and no negative results were found.

Dimilin was also tested on forests around Le Grande, Ore. to determine its effect on the tussock moth, which is deadly to douglas fir trees, and on Utah Lake to observe its effects on nesting birds. Again, the results were negative.

Dr. Booth explained that Dimilin has minimal environmental effect because it breaks down very rapidly in soil and water, unlike DDT which was banned because it remains virulent for years and can be passed up the food chain from plant to animal to man and even from mother to child. He found that half of the Dimilin which was placed in the soil and water was gone in less than two weeks.

Chemically speaking, Dimilin, known also as diflubenzuron, breaks down into difluoro benzoic acid, plus p-chlorophenyl urea, plus p-chloroaniline, none of which are persistent nor are there any known problems with any of them. On the other hand, DDT breaks down in the environment into DDE which causes egg shell thinning in some raptor birds. DDE is also very stable.

Environmentalists have been concerned about the effects Dimilin will have on non-target organisms. At normal use levels, between .1 and 1.0 parts per million, Dimilin results have been favorable.

Dr. Booth says Dimilin is safe on humans. Since he could not test the insecticide on humans, he ran tests on pregnant mice, which are warmblooded like man, and he found no transfer of Dimilin through the mother to the babies.

Dimilin has not affected the yield of any crops that have been

studied except to increase the yields because the insects were controlled. Crops currently being investigated extensively are cotton, soybeans, corn, cabbage and apples.

Dr. Booth admits that there are some disadvantages to Dimilin. One is that it doesn't act the same on all insects. For example, it is effective on tussock moth but ineffective on spruce bud worm. However, he noted that there is no compound made that is effective on all pests.

Also, Dimilin is not as persistent as he would like. For example, it is gone in water in a couple of days. Therefore, more sprayings are necessary.

However, Dimilin does appear to have long-lasting effect on insect control because it prevents the deposition of egg masses which are the source of the following year's infestation.

IN BENTGRASS, IT'S THE ERA of EMERALD!

In days past Golf Superintendents selected Seaside . . . Astoria . . . or Highland because—when it came to bentgrass—that's all that was available.

Then came Penncross. This truly modern variety is a great turf grass. Its only serious challenger is proving to be Emerald (Smaragd variety), the entry developed by Sweden's W. Weibull from a single, superior progeny of Congressional (C-19).

Emerald deserves a second look. Some say it equals, or is better than Penncross in actual use. Here are just a few reasons:

Exceptional uniformity

□ Excellent vigor—more vlgorous than Seaside and slightly less vigorous than Penncross

Disease resistant—no marked susceptibility to common turt diseases or customarily used chemicals

□ Highly competitive pricing—superior quality and yet won't destroy a budget

CIL Sulphur Coated Urea The Number One Controlled Release Nitrogen Fertilizer

Net contents 441b/20kg

Concentrated controlled release Nitrogen fertilitz
 Guaranteed not to burn when used as directed.
 Easy to handle and apply.
 Product of Canada.

Canadian Industries Limite

1975 research plots at the University of Guelph, Canada, where Sulphur Coated Urea was tested against other nitrogen fertilizers, including two commonly recognized as slow release nitrogen fertilizers. CIL Sulphur Coated Urea treated grass in foreground.

Efficient

- Release of nitrogen is controlled by moisture. Temperature and bacterial activity are not important factors.
 Excess moisture however, does not markedly speed up the release of the nitrogen.
- Soil ph does not alter pattern of release.

Background photo

CIL Sulphur Coated Urea prills actual size.

Tested on grass plots under scientifically controlled conditions, CIL Sulphur Coated Urea outperformed all conventional slow release nitrogen fertilizers tested, in both the appearance and growth of grass obtained.

 CIL Sulphur Coated Urea releases nutrients as soon as it is applied and continues to do so evenly over 4 to 5 months. Result is more complete utilization of nitrogen applied, and no build up of nitrates in the soil.

Economical

Effective

- High WIN; low cost per unit of nitrogen compared to other WIN sources.
- Available in bulk or in 44 lb plastic bags.

Please send me more information about CIL Sulphur Coated Urea. Name Company Address Mail to: A. M. (Gus) Peesker, Marketing Manager City Professional Turf Products State Zip Neal P.O. Box 5201 London, Ontario, Canada NeAl 4L6 Telephrone: (519) 672-9220

Omega, a fine-leafed perennial ryegrass variety, is now available through Garfield Williamson Inc.

Combining the deep green appearance of a bluegrass with the rapid germination of a ryegrass, Omega is recommended for upgrading established turf and seeding bare spots, slope, traffice areas and other hard-to-grow places.

Although optimum performance occurs in medium to full sun, Omega is also an excellent component of heavy shade mixtures, blending uniformly with other desirable lawn grasses. Omega also has qualities of drought and disease resistance, cold hardiness, minimum maintenance and adaptability to a wide range of growing conditions.

Omega is available in 25 and 50 lb. emblem bags. Blue tag certified

Poa annua free.

A water-powered chemical injector for injecting liquid and soluble fertilizers and pesticides into an existing or new irrigation system has been introduced by Clearwater Engineering.

The unit has a variable-capacity positive displacement pump, which is powered by the water flowing through an irrigation line. Since the volume and pressure of the flow of water controls the speed at which the injector operates, constant water-to-chemical ratio is maintained.

FYLKING IS A SHOO-IN!

0217[®] brand Fylking Kentucky bluegrass, the famous Swedish beauty, stands out because of its many improved qualities. An outstanding feature is fast germination, rapid growth that makes sod lifting possible sooner than other varieties. Superior density of rhizomes and root system makes an almost impenetrable sod that helps strangle weeds, prevents invasion.

Purity is a prerequisite. Fylking Kentucky bluegrass contains no annual bluegrass (*Poa annua*), bentgrass or short-awned foxtail. Fylking is your guarantee of physically pure, genetically true seed.

Another fine.

FYLKING

KENTUCKY

LIIEGR A SS

quality-controlled product of Jacklin Seed Company

Fylking Kentucky bluegrass seed costs less than most other elite bluegrasses.

Fine-textured, brilliant green turf from early spring to late fall, Fylking is more drought, disease, traffic, heat, cold and smog resistant.

Low-growing, low-mowing characteristics result in fine professional golf tees and home putting greens; can be mowed low as 1/2-inch.

0217[®] brand Fylking Kentucky bluegrass is a shoo-in for first choice in any lawn seed mix. Specify the Swedish beauty, Fylking, at your local wholesale seed or sod distributor.

> Fylking produces multiple branch rhizome and root systems and an abundance of leaf tillers growing more parallel to the ground.

PLAIL SAPE

when your job is grounds maintenance year around, you need a mower for all seasons.

With one **VERSATILE** Mott mower, you can mow fine lawns, shred high grass and weeds, mulch leaves and renovate.

Flail type mowers have a reputation for being **SAFER** than rotary type mowers. Mott mowers... with their lightweight knives... are the safest of the flails.

Mott mowers also offer COST EFFECTIVE PERFOR-MANCE because they last longer and are more reliable to operate.

Write or call for information about YOUR MOWING REQUIREMENTS. This season and every season, mow Flail Safe... with Mott mowers.

THEY'VE JOINED THE DIXIE GREEN[®] FAN CLUB

"As a professional golfer I can say that I have never putted on any perennial ryegrass surface as smooth and more true than that of Dixie Green[®]." Jack Treece, Superintendent Onion Creek Country Club, Austin, Texas.

"Dixie Green[®] has given me a uniform, dense putting surface that has putted consistently true. The color has been outstanding . . . even though the temperature in January dropped to 11 degrees F. Bent greens went off color . . . but Dixie Green[®] came through like a champ." Ed O'Donnell, Superintendent Brook Valley Golf & Country Club, Greenville, North Carolina.

Dixie Green[®] overseeding mixture is a premier mix of Highlight Chewings-type red fescue which was judged World Champion at the 45th Annual Royal Agricultural Show in Toronto, and Derby turf-type perennial ryegrass. This fine mix has proven a winner for winterseeding of greens, tees and aprons all over the South.

Dixie Green®-a great mixture for you and your members.

Having genuine Jacobsen parts in stock makes sense.

Having 3,200 different types of parts makes news.

The average Jacobsen distributor carries about 3,200 different kinds of genuine Jacobsen replacement parts in stock at all times.

That's one heck of a lot of parts. But when a piece of equipment goes down, you want it back in action fast. And with genuine parts because they're made to fit and work perfectly. So a big selection is important.

If you do a lot of your own equipment maintenance and repair, this is just one reason to go with Jacobsen. Here's another. Your Jacobsen distributor can

even help you set up your own inventory of most likely used parts. Which can speed up repairs even more.

If you don't do much maintenance vourself, it's good to know your Jacobsen distributor has plenty of parts, plus trained mechanics who specialize in servicing Jacobsen equipment.

Either way, you're ahead of the Take a look at leadership. game with Jacobsen. Good

with a large supply of genuine parts. And the Jacobsen factory squarely behind the distributor. Just so you always get the same fine performance you expect with equipment that has the name Jacobsen on it.

It isn't hard to find a good argument for going with Jacobsen. There are 3,200 of them in the parts department alone.
