

WARM INSECT from page 33

occurred when tawny mole cricket mating flights had begun in many parts of the Southeast.

Coupled with a spring drought, these early season conditions influenced egg laying and egg hatch. In 1993, in many areas, there was no distinct "peak" tawny mole cricket hatch, and hatching extended well into July.

The spread of imported fire ants is limited by cold weather. Fire ant reproductives (males and females that reproduce)

Subsurface placement of some insecticides results in the same level of mole cricket and grub control with half the rates of surface applications.

fly, mate and queens form new colonies primarily in the spring and fall after rain showers.

A cool, extremely wet or very dry spring may delay new colony development until conditions are more favorable.

Chemical control—Mapping areas of pest activity may narrow both treatment areas and amount of pesticide needed. Grubs and mole crickets usually reinfest the same "preferred sites" each year.

Timing is at least as important as the insecticide you choose. Most pest activity

CULTURAL CONTROL

Integrating a cultural pest management program is neither easy nor inexpensive, but on-going industry research indicates that it can be a viable option to offer customers.

A knowledge of pest history at a site and knowledge of potential insect pests specific to location are important only in the context of frequent inspection of the turf. Proper fertilization, mowing and water use promote healthy turf which can recover quicker from pest damage. Thatch management may discourage development of some pests or enhance pesticide performance when properly timed treatments are necessary.

is influenced by soil and air temperature, moisture and life stage. So keep monitoring records: when insects first hatch, species and life stage, damage, and an overall evaluation of the turf quality.

Improvements continue for placing both liquid and granular insecticide below the soil surface for treatment of mole crickets and grubs. Subsurface placement of some insecticides results in the same level of control with half the rates of surface applications.

With subsurface applications, you have:

- fewer surface residues, which decrease the potential for runoff and human exposure;
- less potential for ULV breakdown; and
- placement close to the pests provides control with less product.

Saturated and poorly drained soil, however, and extremely hot and humid weather influence the effectiveness of liquid injection applications.

Remember also that the pH of the spray water may influence the effectiveness of any insecticide spray applications.

tivars with improved disease resistance. Where disease problems occur repeatedly, consider overseeding with blends and mixtures of improved cultivars. As with many kinds of biocontrol, genetic existence usually works for a single disease problem. That is why blends and mixtures are usually the most appropriate approach to healthy turfgrass. Genetic resistance is most effective when it is integrated with cultural practices and the judicious use of fungicides.

—Dr. Schumann is an associate professor of turf pathology at the University of Massachusetts, Amherst.

Some insecticides—like trichlorfon (Proxol or Dylox) acephate (Orthene) and isazophos (Triumph)—break down in high pH water. Use a commercial buffer to lower the pH of the water to 5.5 to 6.0 before adding one of these insecticides.

Pre-treatment irrigation may make the difference between success and failure during dry, hot periods. Pre-treatment watering does not replace watering after insecticides are applied. Rather, it moves soil pests closer to the surface, making contact with the insecticide more a possibility.

New products include:

● **Turplex** bioinsecticide (azadirachtin), registered for control of surface-feeders (Scotts ProTurf).

● **Vector WG** (*s. glaseri*) for white grub control; **Vector MC** (*s. riobravus*) for mole cricket control (Lesco).

● Mole cricket infecting nematodes (Biocontrol).

● **Exhibit** (*s. carpocapsae*) contains parasitic nematodes for control of billbugs, cutworms and sod webworms (Ciba T&O), as does **Vector TL** (Lesco).

● **Merit** (imidacloprid) is registered for turf (except on sod farms) and landscapes, including white grub control (Miles).

● **Scimitar** for control of several surface-feeders, chinch bugs and mole crickets (Zeneca).

● **Mainstay** (fonofos) for control of grubs, mole crickets, billbugs and others (Lesco).

● **Dylox** is now available as 6.2 formulation (AgrEvo, formerly NorAm).

● **Pageant DF** is a dry, flowable chlorpyrifos product. **Talstar** has received several state registrations (24c's) for fire ant, or fire ant and mole cricket control (FMC).

—Pat Cobb is professor of entomology at Auburn University, Ala.

We Consider All Of These Grasses Part Of Our Turf.

It's not surprising Basagran® T/O herbicide considers grass its turf. No other broadleaf herbicide works as well on so many different lawns.

Bluegrass, fescue, zoysia-grass, you name it, Basagran T/O can be applied over-the-top to get to the bottom of some of your toughest problems – sedges.

And not only is Basagran T/O gentle to use on nearly all established

Unlike other herbicides that just burn yellow nutsedge back above the surface, Basagran T/O travels all the way to the rhizomes and tubers.

turf, it can even be used as a directed spray near some of your favorite ornamental varieties.

And if that weren't enough, Basagran

T/O comes in two convenient package sizes

to fit any job – pint or 1 gallon jug.

Protecting your turf from troublemakers like yellow nutsedge, chickweed or annual sedges has never been easier. Just call

1-800-878-8060.

Simple solutions to complex problems.

Basagran T/O does not control purple nutsedge. Always read and follow label directions. Basagran is a registered trademark of BASF AG. © 1993 BASF Corporation. JJ8931 TO 4 006
