pression is the most practical management approach.

Management strategies

1) Core aeration, deep watering, and proper fertilization make symptoms less obvious.

2) Use wetting agents to improve water infiltration.

 Remove soil to a depth of 18 inches and replace with fresh soil or use a soil furnigant to sterilize the soil.

Nematodes

Nematodes are microscopic unsegmented roundworms. A small group of nematodes can damage turfgrasses. They feed on turfgrasses by puncturing plant cells with a hollow, tube-like structure, and then injecting enzymes into the cells. Nematodes can damage turfgrasses by themselves, or in conjunction with an infectious fungus.

Above-ground symptoms of nematode damage include:

wilting under moderate

moisture stress; slow recovery of

wilted turf after rain or irrigation;

► thinning or gradual decline of turf.

Because nematodes are not distributed evenly in soils, damage rarely appears in uniform areas. Roots damaged by nematodes are usually short and dark colored, with few lateral or 'feeder' roots. They may be rotted because of secondary fungal activity. Sometimes the root tip is swollen. The damaged root system will not hold soil together when a core or plug is lifted.

Management strategies

 Use clean seed or sod and topdressing soil.

 Clean equipment of all dirt, especially when moving from an area infested with nematodes.

Rust in a zoysiagrass lawn. The disease thrives in under-nourished turf.

 Irrigate more frequently to compensate for reduced root systems.

4) Nematicides reduce nematode numbers but don't completely eradicate them from the soil. LM The author is extension plant pathologist, Texas A&M University at Dallas. Watch for her article on disease control in warmseason ornamentals in the June LM. Photos by Janell Johnk.
